VAAGDEVI DEGREE & PG COLLEGE

DIST: HANUMAKONDA,TELANGANA STATE–506001

(Affiliated to Kakatiya University, Warangal)

*(email:*principal@vaagdevicolleges.com

*website:*www.vaagdevicolleges.com)

Criterion Metric: 2.5.1

Mechanism of internal assessment is transparent and robust in terms of frequency and mode

Response:

The College follows a fair and transparent internal assessment process and robust mechanism to enhance the quality of higher education and make available various facilities to students to achieve good results in the examination. The college gives freedom to the departments to select the method of evaluation to bring the variety in the method of internal examination and assessment. The continuous internal evaluation (CIE) component includes class tests, tutorials, assignments, class seminars, group discussion etc. Assessment isan integral part of teaching-learning process. With regular interactions of IQAC and Heads of the Department, Examination Committee makes plan for reforms in evaluation system. The college internal evaluation process is decentralized in order to make it more transparent and objective. As per the academic calendar the college prepare tentative schedule and displayed on the notice board, website and on the whatsapp group of the classes. The college adjust academic calendar by including internal assessments, value added courses and university examination. The college takes extra efforts for slow and advanced learners and they are assessed by different methods. The examination committee monitors and conducts internal examination in the college. The college has mechanism for transparent and robust internal assessment as below.

- The transparency is maintained by sharing answer sheet with students and the grievances of the students about assessment if any are addressed.
- Class tests semester wise with Multiple Choice question pattern are conducted by the subject departments.
- The class seminar is organized by every department.
- Question papers are set as per the university examination pattern.
- Students are provided question bank which is maintained in the college library.
- The subject teacher monitors students fieldwork, visitreport and project works**.**
- Oral examination based on practical work is carried out for the assessment.
- The college has various skill oriented certificate courses which are also assessed by the respective subjects.
- To encourage students to participate in NSS, extra marks are assigned who successfully completes two years of NSS camp. Outstanding performance in cultural activities and sports competition is conducted by the college.
- The attendance record is a part of internal assessment maintained by each subject department.
- Group discussion, essay competition, and quizzes are conducted and assessed by the college.
- Marks of various internal examinations are told and discussed in the classroom.

Report on Students' Assignments for the Academic Year 2023-24

Introduction The Department of Food and Nutrition assigned a series of academic tasks to students during the academic year 2023-24. These assignments were designed to enhance students' understanding of core concepts, develop their analytical skills, and encourage independent learning in the field of food and nutrition.

Objective The primary objective of these assignments was to deepen students' knowledge of food and nutrition topics through research-based and application-oriented tasks, preparing them for academic excellence and practical challenges.

Details of the Program

- **Duration:** Assignments were given throughout the academic year 2023-24.
- **Participants:** Undergraduate and postgraduate students of the Department of Food and Nutrition.
- **Approach:** Individual and group assignments requiring research, analysis, and presentations.

Types of Assignments The assignments covered a broad spectrum of topics, ensuring comprehensive learning. Below are some examples of the assignments:

Assignment Topic	Description
Nutritional Assessment Techniques	Preparing a report on methods used to assess nutritional status.
Dietary Guidelines for Special Groups	Designing diet plans for children, pregnant women, and elderly individuals.
Food Label Analysis	Evaluating nutritional labels of various food products.
Emerging Trends in Food Technology	Researching advancements in food processing and preservation.
Case Studies on Clinical Nutrition	Analyzing dietary interventions for specific health conditions.
Sustainable Food Practices	Proposing strategies to promote sustainability in food consumption.
Functional Foods and Nutraceuticals	Exploring the health benefits and market trends of functional foods.

Impact of the Assignments

- Enhanced critical thinking and research capabilities.
- Fostered a deeper understanding of theoretical and practical aspects of food and nutrition.
- Improved written and oral communication skills through detailed reports and presentations.
- Encouraged collaboration and peer learning in group assignments.

Conclusion The assignments conducted for the academic year 2023-24 were a vital component of the learning process for food and nutrition students. These tasks not only reinforced academic knowledge but also cultivated skills necessary for future career paths. The Department of Food and Nutrition will continue to integrate such engaging and impactful assignments in upcoming academic sessions.

Group :- NOMIC

Subject :- Nutrition

WHEAT MILLING AND ITS BY-PRODUCTS

M. Pharm.
1st yr - Food Science

Products and byproducts of wheat milling process

Abstract

Wheat crop is India's prime most staple harvest, placed second to rice. It is mostly consumed in the north-west parts of the country. Since it is rich in protein, vitamin and carbohydrate. It provides a blanced diet to the consumer. Wheat milling is the process of grinding whole wheat grain and is converted into flour. Wheat flour is the most important ingredient in home baking and is the frame work for almost every commercially baked products and pasta.

Introduction:-

Wheat is a farinaceous grass, known botanically as triticum spp., is one of the most consumed cereal grains world wide and make up a substantial part of the human diet. It provides more nourishment for humans than any other single food crops. According to statista 2013/14 the global production volume of wheat amounted approximately 710 million metric tons. which has shown a 7.7% increment from the previous year. It is the second most important food crop, in the developing world after rice. Ethiopia & south Africa are the two major producers.

Morphology & composition of wheat:

Wheat grains are generally oval shaped, although different types of wheat have grains that range from almost spherical to long narrow & flattened shapes. The grain is usually between 5 and 9mm in length. weighs between 35 & 50 mg and has a crease down one side where it was originally connected to the wheat flower. The wheat grain contains 2-3% germ, 13-17% bran & 80-85% mealy endosperm. products will have different coarseness, textures, and color depending on the portion of the wheat kernel. The function of the endosperm is to provide energy for the embryonic plant during germination of the wheat

ASSIGNMENT - 2

Technology of Sugar confectionary

& Chocolate processing

TECHNOLOGY OF CEREALS, LEGUMS AND OIL SEEDS

CORN   K. Siri chandana

Corn (maize)

＊Introduction :-

→ Scientific name of corn is Zea mays.

→ Maixe referred to as corn in North America.

→ Maixe originated in central Mexico in around 5,000 BC.

→ The crop was introduced to Europe in sixteenth Century, from where it spread to Africa and Asia.

→ It is now one of the most widely-grown crops around the world both temperature and tropical regions.

→ The crop is rich in vitamin c and other vitamins and minerals, as well as carbohydrates and dietary fibre.

→ It is particalarly important source of nutrition, supplying a high energy density of 365 kcal/100g.

→ Maixe has become a staple food in many parts of the world, consumed directly by human, maixe is also used for corn ethanol, animal feed and other products, such as corn starch and syrup.

→ Corn are used varieties for animal feed, various corn-based human food uses (grinding into cornmeal or masa, pressing into corn oil, and fermentation

Electronic Transitions:-

The electrons in organic molecules may be involved, in bonding as strong σ-bonds weaks π-bonds can present in the Non-bonding from [lone pairs]. A Variety of absorptions for electronic transistions within a molecule is thus possible, depending upon the Nature of bonding. Absorption of uv-Visible radiation, therefore elevates these different types of electrons to excited antibonding orbitals.
Types of electronic Transitions:-

Electronic transitions classified into two types i.e:-

1) Transitions between bonding and Antibonding orbitals.

2) Transitions between Non-bonding atomic orbitals and Antibonding orbitals.

1) Transitions between bonding and Antibonding orbitals:-

These are of two types i.e:-

i) $\sigma \rightarrow \sigma^{*}$ ii) $\pi \rightarrow \pi^{*}$

Electronic transitions

i) $\sigma \longrightarrow \sigma^*$:-

In these transitions electrons, transfered, from 'σ' bonding Molecular orbitals to σ* Antibonding molecular orbitals. It's a high energy process because there is a large energy difference between σ and σ* Molecular orbitals, σ bonds are in General Very strong

ex:- un visible

$$-\overset{|}{\underset{|}{C}}\cdots\overset{|}{\underset{|}{C}}- \xrightarrow{\sigma-\sigma^*} -\overset{|}{\underset{|}{C}}\cdot\cdot\overset{|}{\underset{|}{C}}-$$
Alkane

$S = (2S+1)$ $S = 0$

$S = (2×0+1)$

$S = 1$ singlet

$S = (2S+1)$

$S = (2×1+1)$ $S = 1$

$S = 3$ triplet

In $\sigma \rightarrow \sigma^*$ electronic transition spin multiplicity of

→ e electrons undergoes inversion (singlet state to triplet state).

→ $\sigma \rightarrow \sigma^*$ electronic transitions takes place in saturated hydrocarbons.
ii) $\overline{\pi \rightarrow \pi^*}$:-
In-those transitions electrons transferred from π-bonding, Molecular orbital to π^*-Anti-bonding molecular orbitals. This type of transitions occur in unsaturated centres of Molecules, i.e:- in compounds containing double or triple bonds, and also in Aromatics. The Excitation of π- electrons requires smaller energy.

eg:-

$$\sum_{c} C \overset{\overline{\pi}}{\underset{\sigma}{=}} C \xleftarrow[\pi-\pi^*]{\text{UV-visible}}$$

$S = 0$

$G = (2S+1)$

$G = (2 \times 0 \times 1)$

$G = 1$

singlet

$S = 1$

$G = (2S+1)$

$G = (2 \times 1 + 1)$

$G = 3$

Triplet
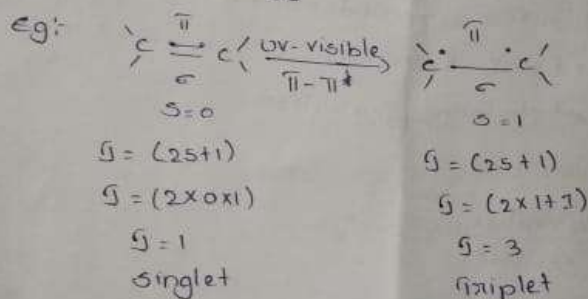

2) Electronic transitions between Non bonding atomic orbitals and Antibonding molecular orbitals:-

Orbitals:-

These are of two types ie:-

i) $n \rightarrow \pi^*$ ii) $n \rightarrow \sigma^*$.

i) $n \rightarrow \overline{\pi^*}$:-
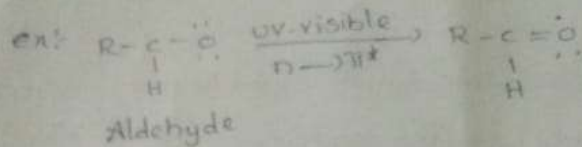

In these transitions Electrons transferred from Non-bonding atomic orbitals to the antibonding π-molecular orbital (π^*). This transition requires least amount of energy at

-the transitions it's takes place in compounds containing double bonds involving hetero atoms bearing unshared pair of electrons.

ex: $\left[\ce{C=\ddot{O}} , \ \ce{C=\ddot{S}} , \ -\ce{N=\ddot{O}} \right]$

ex: $\underset{\underset{H}{|}}{R-C}-\ddot{O}\ddot{:} \xrightarrow[n \to \pi^*]{uv\text{-}visible} \underset{\underset{H}{|}}{R-C}=\ddot{O}$

Aldehyde

ii) $n \to \sigma^*$:

In these transitions electrons transferred from Non-bonding atomic orbitals to Antibonding e-molecular orbital (σ^*). It's takes place in saturated compounds containing one hetero atom with unshared pair of electrons. It's required less energy than $\sigma \to \sigma^*$ electronic transition.

ex:

$\underset{|}{\overset{|}{C}} - \ddot{X}\ddot{:} \xrightarrow[n \to \sigma^*]{uv\text{-}visible} \underset{|}{\overset{|}{C}} - \ddot{X}\ddot{:}$
Alkyl halides

energy order of electronic transitions :-

$\sigma \to \sigma^* > n \to \sigma^* > \pi \to \pi^* > n \to \pi^*$

* Classification of chromatography :-

⇒ chromatography is classified into mainly two types:-

1] Based upon phases

2] Based upon principles

1] Based upon phases:- Based upon phase that is stationary and mobile phase chromatography is classified into mainly ~~two~~ four types.

  1] solid - liquid chromatography technique

  2] solid - gas chromatography technique

  3] Liquid - liquid chromatography technique

  4] Liquid - gas chromatography technique

1] solid - liquid chromatography Technique :-

In this chromatography technique stationary phase is solid and mobile phase is liquid.

⇒ It is also called as absorption chromatography

  Ex:- Thin layer chromatography , Ion exchange chromatogra -phy , column chromatograph.

2] solid - gas chromatography Technique:-

In this chromatography technique stationary phase is solid and mobile phase is gas.

⇒ It is also called as absorption chromatography.

  Ex:- gas solid chromatography.

3] liquid - liquid

In this chromatography technique both the stationary and mobile phase and liquid.

=> It is also called as partetion chromatography.

Ex :- paper chromatography

2] HPCL

4] liquid - gas

In this chromatography technique stationary phase is liquid and mobile phase is gas.

=> It is also called as partetion chromatography

Ex :- Gas chromatography

Chromatography
|

Solid as stationary Phase [Absorption chromatography]

liquid gas stationary phase (partetion chromatography)

liquid - mobile phase   gas - mobile phase.

Ex :- Thin layer chromatography.

2] Ion exchange chromatography.

3] column exchange chromato -graphy.

1] gas - solid chromato -graphy. Ex:- paper chromatography HPCL

liquid - mobile -phase

Gas molecole mobile pha

Ex :- gas chromato -graphy

* Finger Print Region:

In electromagnetic radiation $667\ cm^{-1}$ to $4000\ cm^{-1}$ is called as IR region as. It is classified into two parts, i.e.,

i) Finger print region ($667 - 1500\ cm^{-1}$)

ii) Functional group region ($1500 - 4000\ cm^{-1}$).

With the help of finger print region we can determine the identity of organic compounds because in functional group region when the compounds are having same functional group and different structure also gave to same spectrum. So it's not differentiated from each other. But it's spectra recorded by using fingerprint region IR radiation then it gives different types of spectra although it containing same functional groups. So it is differentiated from each other with the help of IR spectra of compounds.

Due to presence of chromophores compound absorbed the light from visible region and its appeared as the coloured compounds to the human eye.

There are two types of chromophores

a) chromophores in which the group contains π-elements and they undergo $\pi \rightarrow \pi^*$ transition.

b) chromophores which contains both π-electrons and non-bonding electron (n) undergo two types of transition $\pi \rightarrow \pi^*$ and $n \rightarrow \pi^*$.
2) **Auxochromes :-**

An auxochrome can be defined as any group which doesnot itself act as a chromophore but whose presence brings about a shift of the absorption band towards the longer wave length.
Ex:- $-\ddot{O}H$ (Hydroxy) $-\ddot{O}-R$ (Ether)

$-\ddot{N}H_2$ (Amine) $-\ddot{N}H-R$ (2° amine)
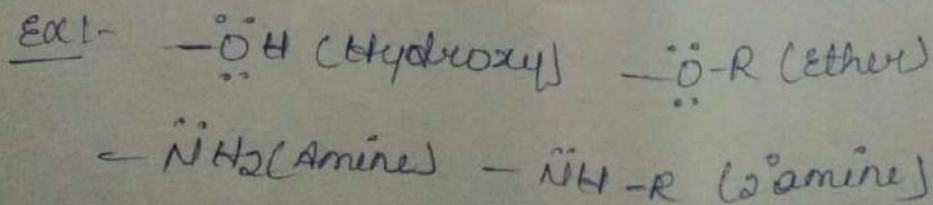

Chromophore :-

A chromophore is defined as any system which is responsible for imparting color to the compound

Ex!-

$$\underset{\text{Alkene}}{\overset{\diagdown}{\underset{\diagup}{C}}=\overset{\diagup}{\underset{\diagdown}{C}}} \qquad \underset{\text{Alkyne}}{-C\equiv C-} \qquad \underset{\underset{\text{Aldehyde}}{H}}{\overset{R-C=O}{|}} \qquad \underset{\text{Nitro}}{R-NO_2}$$

$$\underset{\text{Acid}}{\overset{-C=O}{\underset{OH}{|}}} \qquad \underset{\text{Azo}}{-N=N-} \qquad \underset{\text{Amide}}{\overset{-C-NH_2}{\underset{O}{||}}}$$
Nitro compounds are generally yellow in color due to the presence of $-NO_2$ group

Nitro benzene
chromophore –
(Nitro group)

Benzene diazonium
chloride
chromophore – AZO group.

The Effect of the auxochromes
is due to its ability to extend
the conjugation of a chromophore by
the sharing of non-bonding electrons.
Thus, a new chromophore results
when has a different value of the
absorption maximum as well as the
extinction coefficient.

Ex:-

Benzene shows an absorption max-
imum at 255 nm where as Aniline
absorbs at 280 nm. Hence amino groups
is an Auxochrome.

Benzene
colourless

Aniline
light yellow

$-\ddot{N}H_2$.
Auxochrome.

Similarities between Lanthanides & Actinides :-
-> Both series show +3 oxidation state.
-> In both the series f-orbitals are being progressively filled.
-> Both show the decrease of atomic size & with increase atomic number [Lanthanide contraction] & [Actinide contraction].
-> Due to f-f-transition the absorption spectra of the elements of both the series / elements give sharp line like band spectra the.
-> The electronegativity value of elements of both the series are low & these elements are quite reactive.
-> The nitrate, percholate & sulphates of the valence elements of both series are soluble.
-> The carbonates & hydroxides of the valence elements of both series are soluble.
-> The carbonates & hydroxides of trivalent of both the series are insoluble.
-> Members of both the series show ion exchange behaviour.

Lanthanides	Actinides
-> The chemistry of all members of this series is very similar due to large energy difference in 4f and 5d sub level.	-> Considerable variants is observed in the these elements. This is due to very small energy difference 5f & 6d sub level.
-> They have high binding energy.	-> These binding energy is low.
-> These elements exhibits a maximum oxidation state of 4+	-> Due to lower binding energies these elements show higher oxidation states are well such as +4, +5, +6, +7 oxidation state.
-> The paramagnetic properties shown by the elements can be easily explained.	-> The paramagnetic properties of the elements are different to explain.
-> These complex formation tendency is not very high. These complexes with π bondligand are not known	-> They show a very high tendency to form complexities-they form complexes with π-bonding ligand such as thio-ethers.
-> Except pm, the elements of the series are non radis active.	-> The elements of this series are radio active.

Heat Capacity of a system (or) a gas

Heat capacity of a system is defined as the amount of heat observed by it. In raising it is temperature by 1°.

If Q calories is the heat absorbed by a system and the temperature rises from $T_1 k$ to $T_2 k$ then heat capacity (c) of the system or gas is given by the expression.

$$C = \frac{Q}{T_2 - T_1}$$

$$C = \frac{Q}{\Delta T} \quad —(1)$$

Heat capacity for 1 gram of a substance are known as specific heat while heat capacities for 1 mole of gas are known as molar heat capacity and disignated with 'c'.

If Q is the small amount of heat absorbed by a system and temperature of the system increases by a small amount than the heat capacity of the system is given.

$$C = \frac{\partial Q}{\partial Q} \quad c = \frac{\partial Q}{\partial T} \quad —(2)$$

Thus, heat capacity may be defined as the ratio of the amount of heat absorbed to the rise in temperature.

Units: $cal\ deg^{-1} mol^{-}$

$\qquad cal\ k^{-1}\ mol^{-}$

Q is not a state function and depends upon the path.

∴ Heat capacity is also not a state function.

Hence it is considered as path function.

Hybridisation

- Intermixing of atomic orbitals nearly same energy to form hybrid orbitals of equal energy and identical shape

- it is proposed by pauling to explain shapes and bond angles of molecules which can it be explained by VBT

Types:-

1) sp

2) sp^2

3) sp^3

4) sp^3d

5) sp^3d^2

6) sp^3d^2

- Sp hybridisation :-

• One s orbital & one p orbital ⇒ 2sp hybrid orbitals

2 s p

↓   ↓
50% of S   50% of p
Bond angle = 180°

shape = linear shape

Ex: BeCl₂ (Beryllium chloride)

Ground state of Be $= 1s^2 \ 2s^2 \ 2p^0$

↑↓	↑↓			
Excited state of Be $= 1s^2 \ 2s^2 \ 2p^1$

↑↓	↑	↑		

Sp - hybridisation

$Cl = 17 = [Ne] \ 3s^2 \ 3p^5$

↑↓	↑↓	↑↓	↑

$P_x \ P_y \ P_z$

180°

Cl — Be — Cl ⇒ 2σ bonds.
Defination :-

One 'S' orbital & one 'p' orbital of nearly same energy intermixing to form two sp hybrid orbitals is called sp hybridisation.

- The bond angle between with these is $180°$ and each sp hybrid orbital has 50% 's' character and 50% of 'p' character. The valency of Beryllium should be zero but it exhibits valency "two" in its compounds.

- To explain this Beryllium atom is considered to be present in the excited state, when one of the 2s electron enter into the $2p_x$ orbital.

- This is explained by sp hybridisation of Beryllium.

- The two orbitals are linear shape and at an angle $180°$

- These sp hybrid orbitals of Berylium overlap two 2ps, two $2p_y$ orbitals of chlorine to give two σ bonds in beryllium chloride orbitals ($BeCl_2$

- Sp^2 hybridisation

Ex: BCl_3 (Boron trichloride)

Ground state $B = 1s^2\ 2s^2\ 2p^1$

Excited state $B = 1s^2\ 2s^1\ 2p^2$

— One s orbital and two p orbitals of nearly same energy intermixes to form $3sp^2$ hybrid orbitals is called sp^2 hybridisation

— The bond angle between these is $120°$ & each sp hybrid orbital has 33.3% "s" character and 66.6% "p" character

ex: BCl_3 (Boron trichloride)

Ground state of $B = 1s^2\qquad 2s^2\qquad 2p^1$

$$[↑↓]\qquad[↑↓]\qquad[↑\ |\ \ |\ \ ]$$
Excited state of $B = 1s^2\ 2s^1\ 2p^2$

$$[↑↓]\qquad[↑]\qquad[↑|↑|\ \ ]$$
$$\underbrace{}\ \ P_x\ P_y\ P_z$$

$$sp^2\ \text{hybridisation}$$

$Cl = 17 = [Ne]\ 3s^2\ 3p^5$

$$[↑↓]\qquad[↑↓|↑↓|↑]$$

Shape:

Cl

$|$

B ⟩ $120°$

/   \\

Cl   Cl
$\Rightarrow$ "3σ bonds"

Sp³ hybridisation:

One s orbital and three p orbitals of nearly same energy intermixes to form 4 sp³ hybrid orbitals in sp³ hybridisation.

Ex : CH_4 - Methane

Ground state of $C = 1s^2 \; 2s^2 \; 2p^2$

↑↓		↑↓		↑	↑	

$P_x \; P_y \; P_z$
Excited state of $C = 1s^2 \; 2s^1 \; 2p^3$

↑↓		↑		↑	↑	↑
Sp³ hybridisation

— $H = 1s^1$ [H = hydrogen]

↑

Shape :
$109°28'$

- 4 σ bonds

- Bond angle $109°28'$

- Tetrahedral shape

- In sp³ hybridisation the 's' character has 25% & 'p' character has 75%.

Hunsdiecker Reaction

Silver Carboxylates are Reacted with Bromine in presence of CCl_4 solvent to Form Alkyl Bromides

Reaction

$$R-\underset{\underset{O}{\|}}{C}-O^{\ominus} Ag^{\oplus} \xrightarrow[\Delta CCl_4]{Br_2/} R-Br + AgBr + CO_2 \uparrow$$

$$\text{(Silver carboxylate)} \qquad \text{(Alkyl Bromide)}$$

Mechanism:

(i) $R-\underset{\underset{O}{\|}}{C}-O^{\ominus}\boxed{Ag^{\oplus} + Br} - Br \xrightarrow{CCl_4} R-\underset{\underset{O}{\|}}{C}-O-Br + AgBr$

(Br^+, Br^-)

(ii) $R-\underset{\underset{O}{\|}}{C}-O \overset{h\nu}{-} Br \longrightarrow R-\underset{\underset{O}{\|}}{C}-\dot{O} + \dot{Br}$

(iii) $R\overset{h\nu}{-}\underset{\underset{O}{\|}}{C}-\dot{O} \longrightarrow \dot{R} + \underset{\underset{O}{\|}}{C}{=}\ddot{O}$

(iv) $\dot{R} + \dot{Br} \longrightarrow R-Br$

Eg: $H_3C-CH_2-\underset{\underset{O}{\|}}{C}-O^{\ominus} Ag^{\oplus} + Br-Br \xrightarrow[\Delta]{CCl_4} H_3C-CH_2-Br + CO_2\uparrow$

$+ AgBr$

(Silver propanoate)   (Ethyl Bromide)
molecule Schobrock & Paul proposed this theory.
- Postulates of VSEPR Theory:

• The shape of a molecule depends upon number of valency shell electron pair around the central atom.

Ex: $BeCl_2$ - Beryllium chloride

C: Be·

$$Cl - Be - Cl \quad 180°$$
• Number of bond pair electron and number of lone pair electron are depends on the central atom

• Electron pair arranged around the central atom in such a way in which replusion between them is minimum.

• Electron pair in which bonding inbonding are called bond pairs which are not involved in bonding are called lone pairs.

Replusion order:

$$\text{Lone pair} - \text{Lone pair} > \text{lone pair} - \text{Bond pair} > \text{Bond pair} - \text{Bond pair}$$
• Lone pair occupies more space than bond pair (lone pair attracted by single atom and bond pair attracted by two atoms)

SILICONES

- Silicones are polymers of organometallic compound containing a network of alternating silicone and oxygen atom.
- They are polymeric compounds having Si-O-Si linkage

PREPARATION

1. By use of Grignard reagent
- $SiCl_4$ [silane] react with Grignard reagent and form 3 types of silanes
- Mono Methyl Trichloro silane
- Di Methyl Dichloro silane
- Tri Methyl Mono chloro silane

1) $SiCl_4 + H_3C\,MgCl \longrightarrow CH_3SiCl_3 + MgCl_2$
   (Mono Methyl Trichloro silanes)

2) $H_3C\,SiCl_3 + H_3C\,MgCl \rightarrow (H_3C)_2SiCl_2 + MgCl_2$
   (Di Methyl Dichloro silane)
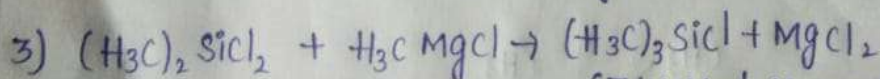

3) $(H_3C)_2\,SiCl_2 + H_3C\,MgCl \rightarrow (H_3C)_3\,SiCl + MgCl_2$
   (TriMethyl Mono chloro silane)

Silicones are classified into 3 types

1) Linear Silicones
2) Cyclic silicones
3) Cross linked silicones

Cross linked silicones

When alkyl Trichloro silane undergoes hydrolysis, the obtained product undergoes condensation and form cross linked silicones

$$H_3C-\underset{\underset{Cl}{|}}{\overset{\overset{Cl}{|}}{Si}}-Cl \xrightarrow{H_2O} H_3C-\underset{\underset{OH}{|}}{\overset{\overset{OH}{|}}{Si}}-OH + HO-\underset{\underset{OH}{|}}{\overset{\overset{OH}{|}}{Si}}-CH_3$$

$$H_3C-\underset{\underset{OH}{|}}{\overset{\overset{OH}{|}}{Si}}-HO \quad — \quad \underset{\underset{OH}{|}}{\overset{\overset{O}{|}}{Si}}-CH_3$$

$\downarrow -4H_2O$

$$H_3C-\underset{\underset{O}{|}}{\overset{\overset{}{|}}{Si}}-O \longleftarrow \underset{\underset{O}{|}}{\overset{}{Si}}-CH_3$$

$$H_3C-\underset{\underset{OH}{|}}{\overset{\overset{}{|}}{Si}}-O \quad — \quad \underset{\underset{OH}{|}}{\overset{}{Si}}-CH_3$$

Properties of silicones

· Silicones are thermally stable and better than organic compounds

· They are having hardness & inertness in them

· The Elastic nature of silicone rubber is greater than that of Natural Rubber

· Silicones can with stand high temparature and sunlight

Applications of Silicones

4 types of applications are there

1. silicone fluids

2. Silicone Rubber

3. Silicone greases

4. Silicone resins

Cross linked silicones

When alkyl Trichloro silane undergoes hydrolysis, the obtained product undergoes condensation and form cross linked silicones

$$H_3C - Si(Cl)_2 - Cl \xrightarrow{H_2O} H_3C - Si(OH) - OH + HO - Si(OH) - CH_3$$

$$H_3C - Si(OH) - HO \longrightarrow Si(OH) - CH_3$$

$$\downarrow -4H_2O$$

$$Hf - Si(O) - O \longleftrightarrow Si(O) - CH_3$$

$$H_3C - Si(OH) - O \longleftrightarrow Si(OH) - CH_3$$

Properties of silicones

- Silicones are thermally stable and better than organic compounds
- They are having hardness & inertness in them
- The Elastic nature of silicone rubber is greater than that of Natural Rubber
- Silicones can with stand high temparature and sunlight

Applications of silicones

4 types of applications are there

1. Silicone fluids
2. Silicone Rubber
3. Silicone greases
4. Silicone resins

1. Silicone fluids :- Simple straight chain Silicones containing 20-500 units are used to prepare silicone fluids.

- They are used as water repellants as they contain organic side chain
- Silicone vapour are used in water proof building, glass material, Papers and cloth

2. Silicone Rubber :- These are long straight chain polymer with cross link

- Silicone Rubbers are used as incubators in Electrical instruments and Electric Motors

3. Silicone greases :- In aeroplanes silicones are used as greases or lubricant

4. Silicone resins :- These are used in manufacture of Paints and Enamels

- Silicones are also used as Non-stick coating for pan & Moulds for car tyres.

Electron Transfer Reactions of Complexes (Redox Reactions):-

→ These are the reactions in which the transfer of an Electron from one atom to other occurs and hence oxidation States of same atoms changes based on mechanism.

→ These reactions mainly classified into 2 types

i) Inner sphere mechanism /Atom (or) Group transfer mechanism (or) Bridge activated complex mechanism.

2) Outer Sphere mechanism / Direct $e^\ominus$ transfer / Tunneling mechanism.

1) Inner Sphere Mechanism :- These are the reactions in which $e^\ominus$ transfer takes place through a bridged group common to complex to the shells of both the metal ions.

$$\left[\overset{III}{Co}(NH_3)_5 X\right]^{+2} + \left[\overset{II}{Cr}(H_2O)_6\right]^{+2} + 5H_3O \longrightarrow \left[\overset{II}{Co}(H_2O)_6\right]^{+2}$$

Oxidant   Reductant

$Co^{+3} \longrightarrow 3d^6$ $Cr^{+2} \longrightarrow d^4$
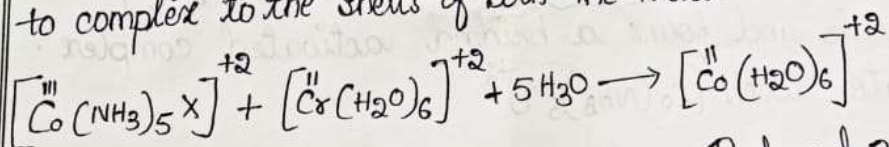

low spin & inert   High Spin & labile

Reduced product

$Co^{+2} \longrightarrow d^7$

High Spin & labile

+

$$5NH_4 + \left[Cr(H_2O)_5 X\right]^{+2}$$

oxidised Product

$Cr^{+3} \longrightarrow d^2$
lowspin & inert

$X = F^-, Cl^-, Br^-, I^-, SO_4^-, NCS^-, N_3^-, PO_4^{-3}, P_2O^{-4}, CH_3COO^-$ etc.

Mechanism:-

$$[(CH_3N)_5 \overset{III}{Co} - X]^{+2} + [(CH_2O) \overset{II}{Cr} (H_2O)_5]^{+2} \xrightarrow{-H_2O} [(CH_3N)_5 \overset{III}{Co} - X - \overset{III}{Cr}(H_2O)_5]$$

$$\downarrow e^{\ominus} transfer$$

$$[(NH_3)_5 Co(H_2O)] \xleftarrow{+H_2O} [(H_3N)_5 \overset{III}{Co} - X \xleftarrow[e-]{e-} \overset{II}{Cr}(H_2O)_5]^{+4}$$

Bridged activated complex

$$\downarrow +5H_2O \qquad +$$

$$[\overset{II}{Co}(H_2O)_6]^{+2} \qquad [\overset{III}{Cr}(H_2O)_3 X]^{+2}$$

Redused Product   oxidised product
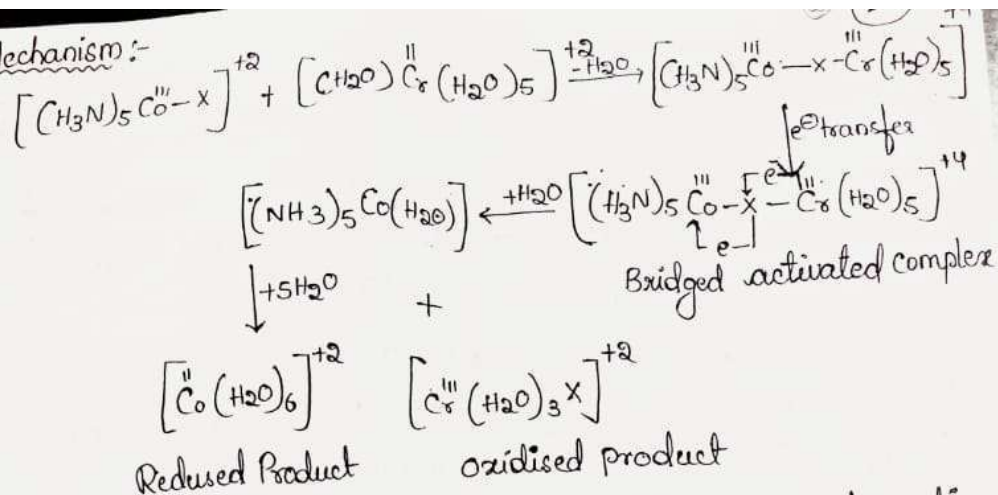

→ In the inner sphere mechanism proceeds through formation of bridged intermediate followed by dissociation and $e^{\ominus}$ Transfer.

* Step (1) :- The Hexa aquo chromium (II) $[\overset{II}{Cr}(H_2O)_6]^{+2}$ loses a water molecule and forms a bridged activated complex. intermediate with $[Co(NH_3)_5 X]^{+2}$.

* Step (2) :- In the activated bridged complex the $e^{\ominus}$ transfer takes place from Cr^{+2} ion to Co^{+3} through the bridge i.e $X^{\ominus}$. then the intermediate dissociates to give 6-co-ordinated $[Cr(H_2O)_5 X]$ complex and 5-co-ordinated $[Co(NH_3)_5]$ complex.

* Step (3) :- The 5-Co-ordinated Co^{+2} complex reacts with H_2O molecule from the medium and forms. 6-co-ordinated penta amine aquo cobalt (II) complex i.e, $[(CH_3N)_5 Co(H_2O)]^{+2}$ complex.

* Step (4) :- The 6-Co-ordinated Co(II) complex. i.e, $[(CH_3N)_5\overset{II}{Co}(H_2O)]^{+}$ Is unstable. hence, it undergoes complete aquation to give

Hydrated Cobalt (11) complex i.e, $[Co(H_2O)_6]^{+2}$.

→ In this mechanism, the electron is shifting from one metal (Cr^{+2}) to another metal (Cr^{+3}) with in the co-ordination sphere. Hence, it is called inner sphere mechanism. and also the atom(x) Is transferred from one metal complex $[Co(NH_3)_5X]^{+2}$ to another $[Cr(H_2O)_6]^{+2}$. Hence it is called group (or) Atom transfer mechanism.

→ The e transfer is taking place only to the formation of the Bridge activated complex. So, this mechanism is also called as "Bridged activated complex mechanism".

→ The rate of e transfer changes when there is change in the Halogen i.e, $SO_4^{-2} > Cl^- > F^-$

         fast   slow

$$F^- < Cl^- < Br^- < I^- < SO_4^{-2}$$
Slow   fast

* Generalised Mechanism :-

Step(1) :- formation of precursor bridged activated complex:

$$Ox-x + Red-H_2O \xrightarrow{-H_2O} Ox-x-Red$$

Step(2) :- Electron Transfer associated with Rearrangement.

$$Ox \overset{\lceil e^- \rceil}{\underset{\lfloor e^- \rfloor}{-x}} Red \longrightarrow Ox^{\ominus} \underline{\quad\quad} x-Red^{\oplus}$$

Step(3) :- Dissociation of Bridged activated complex.

$$Ox^{\ominus}\underline{\quad} x - Red^{\oplus} + H_2O \longrightarrow Ox-H_2O + Red-x$$

$$Rate \propto [Reductant][oxidant]$$

$$\therefore It\ is\ 2^{nd}\ order.$$

2) Outer Sphere Mechanism : (28)

→ These are the reactions in which the co-ordination sphere of ions undergoing redox reaction is not altered.

→ These reactions occurs by direct e^- transfer.
* Generalised Mechanism :

Step (1) : formation of Precursor Complex :

$$Ox + Red \rightleftharpoons Ox \| Red \ (Precursor \ Complex).$$

Step (2) : $e^\ominus$ transfer by rearrangement to give Successor Complex :

$$\overset{\overset{e^\ominus}{\longleftarrow}}{Ox \| Red} \longrightarrow \overset{\ominus}{Ox} \| \overset{\oplus}{Red} \ (Successor \ Complex).$$

Step (3) : Dissociation of Successor Complex to form Products :

$$\overset{\ominus}{Ox} \| \overset{\oplus}{Red} \rightleftharpoons \overset{\ominus}{Ox} + \overset{\oplus}{Red}$$

Ex :-

$$\left[\overset{*}{Fe}^{II}(CN_6)\right]^{-4} + \left[Fe^{III}(CN)_6\right]^{-3} \longrightarrow \left[\overset{*}{Fe}^{III}(CN)_6\right]^{-3} + \left[Fe^{II}(CN)_6\right]^{-4}$$

Reductant   oxidant   ferricyanide   ferrocyanide

          $\underbrace{\qquad}_{e^\ominus}$

ferrocyanide   ferricyanide
low spin &   low spin & inert
  inert

$$\overset{*}{Fe}^{II}\text{---}CN + \overset{III}{Fe}\text{---}CN \cdot \quad \overset{*}{Fe}^{III}\text{---}CN + \overset{II}{Fe}\text{---}CN$$

long bond   short bond   short bond   long bond.

$$[Ox] + [Red] \longrightarrow \overset{\overset{e^\ominus}{\longleftarrow}}{[Ox] [Red]} \longrightarrow [\overset{\ominus}{Ox}] [\overset{\oplus}{Red}] \longrightarrow [\overset{\ominus}{Ox}] + [\overset{\oplus}{Red}]$$
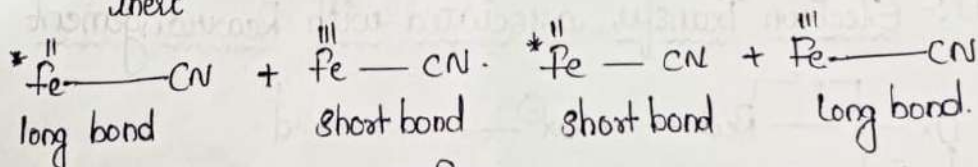

→ In this mechanism, $e^\ominus$ is jumping from one co-ordination sphere to another co-ordination sphere. Hence, it is called as "Outer-Sphere mechanism".

1Q. Explain about diseases?

A. Disease:— Any condition that impairs the normal functioning of a body or disfunctioning of normal body process is called a disease.

The endogenous biochemical imbalance in humans, animals and plants is called as a disease.

Types of diseases:-

1. Common diseases:— Diseases which arise due to changes in climate, place season. Envt personol hygiene are called as common diseases.

Eg:- fever, cold, body pains, headache, heart diseases

Air borne diseases:- Diseases caused by pathogen, transmitted through air are termed as Air borne diseases.

Eg:- Small Pox, chicken Pox - varicella zosks virus, cold- Rynovirus, TB - Bacterial infection.

Water borne diseases:- Disease caused by pathogens transmitted through water are termed as water borne disease.

Eg:- Typhoid- Salmonella Typhe bacteria.
        Chlocra- E-coli (Escherichia coli)
        Jaundice- Hepatitis-A.

Insect borne disease: Disease caused by insect borne like housefly, bugs, are called insect borne disease.

eg:- Malaria -- Araphilis mosquitoes.
dengue fever -- Aedes mosquitoes.
Chicken gunia - chicken gunia virus

Heridetory disease:- These are genetic diseases caused by genetic mutation -that are heriditory.

eg:- womn syndrone - Agenetic chromosome disorder
Bold head.
-- Haemophilia.
Sickle cell anaemia (Damage of blood cells).

Communicable disease:- Those disease spread from person -to person are considered as communicable diseases.

→ They may caused by micro organism such as bacteria, viruses, parasites, directly or indirectly from one person -to another.

-) Some are-transmitted -through bites-from insects while other are caused by ingesting contaminated food or water.

-eg:- Tuberclasis.

Non-communicable disease:- These are non-transmissible, -that means they do not spread from one-to another person.

eg:- Diabetic -- Auto immune disease, cancer etc.

3) Explain about drug nomenclature and Explain about chiral names of drugs?

-A. Nomenclature of drugs :- Names of drugs can be studied under three headings :-

a. Chemical names :- All drugs are chemical substances they have chemical names, depending upon their molecular structure During drug development & production, chemical names are used the chemical names are complex or general use.

-Eg :- Acetyl salicylic acid or 2-acetoxy benzoic acid is familiar as aspirin.

b. Generic names :- After the production during chemical trials and marketing generic names or non-prospeity names will be given importance for early use Of non-technical person.

-Eg :- Acetyl salicylic acid called as 'aspirin' these names will approved by various higher organisations Such as food &drug administration (FDA) etc.

Trade name or Trade mark :- Commericial developers from pharmaceutical industry select the names depending on drug grouping activity, Ease to recall, drug action the company Eg -these trade name

given by the company should get acceptance from the same name unless permission is granted.

eg: Aspirin is Sold as " wisprin "

$$COOH$$
$$-O\,COCH_3$$
Chemical name : 2-acetoxybenzoic acid.

Trivial name : Acetyl salicylic acid (ASA)

Generic name : Aspirin.

Trade name : Bufferin, Ecatrin, Empirin.

classification of drugs:

Explain about classification of drugs?

Drugs are classified into two groups.

i) With respect to the chemical structure,

ii) With respect to the therapeutic action.

Chemical Structure :-

There is a relation b/w chemical structure and biological activity organic-functional group in the molecule are responsible for durg activity. properties like governing drug action at action site, ability to rxn site, dissociation constant, isoterm and bio-isoterism the dry action at active site may be structurally specific & non-specific. non specific drug biological characteristics depends on physical properties like solubility, vapour pressure distribution, co-efficient, pH levels etc.

* After administration of drug the drug reaches to the active site, after that the factors like absorption, distribution, bio-transformation and excretion occurs.

ii) Therapeutic action:-

a. chemotherapeutic agents:- Drugs used to fight against the pathogenic organism and are called chemotherapeutic drugs or agents.

→ During the treatmet of infections, diseases, drug will destroy the parasite without damaging the host tissue.

b. pharmacodynamic agents:- The drugs which after the biochemistry of the body to regulate the body are pharmacodynamic agents.

→ These druge react selectively on the target of the system of body.

eg:- Central nervous system (cnls), cardiovascular system.

c. Vitamins & Harmones:-

The supplements age essential to the well being of body Vitamins age indispensable micro nutrients that organisms cannot produce by themselers small quantities of vitamin age required for proper function of metabolism harmones serve as chemical messengers from one part of an organism to another.

vitamins:- Total 13-types of vitamins age essential these age categorized into two groups as one is water soluble and another is fat soluble.

59. Explain about ADME [Absorption, Distribution, Metabolism and Excretion] of drugs?

A: Absorption:- Movement of a drug from the site of administration to blood stream is called "Absorption" of drug. Generally most of the drugs are absorbed in small intestinal. but drugs spend much less time here due to small surface cross this bi-layer to reach it's site. Acidic drug absorbed in intestine.

Routes of administration of drugs:

The way of taking drug into body system is called drug administration.

1. Orally drugs:- Majority of drugs are taken orally oral Medicines takes around 30min to Enter into blood stream and Show it's activity. It is most common method Ex:- Tablets, capsules, Syrups, chewable tablets etc.

2. Parenteral drugs:- The drugs are directly injected into the body is called as "parental drugs". these drugs are oral administration of drugs.

a. Intra muscular (Im):- Drugs which are injected into muscles are called as Intra muscular drugs.

b. Intravenous (Iv):- Drugs which injected into veins are called Intravenous drugs.

c. Subcutaneous drugs:- Drugs which are injected under skin are called Substaneous drugs.
Ex:- Insolin.

3. Topical / Cutaneous drugs :- Drugs applied to skin age called topical drugs.
Ex:- creams, ointments, sprays etc.
Due to chemical prep^n drugs age absorbed either by " Passive diffusion' or' active transpot."
Passive diffusion :- This is facilitated by the conc^n gradient across the membrane the drug moves from higher conc^n to lower conc^n. It dosen't require an extra carrier or extra energy.
— water soluble agents use aqueous pares in the membrane.
— Lipid (fat) soluble diffuse directly through membrane.
Active transport :- In this process specific carriers and ATP age required. the specific carrier protein carry the drug that closely resemble the struture of the naturally occuring Metabolities specific from Carrier It is capable of transporting from low to high conc^n compartments.
Distribution :- Movement of drug to various part of body is called distribution.
-> The distribution abiiity depends on strength of the body.
-> Protein bonding. If the bond is strong the distribution capacity is less.

all these vitamins come from the food. On the other hand body can produce vitamin D&K.

Water Soluble vitamins:- These vitamins get dissolved in water easily. In circulation it will be utilized by body and excreted from urinary output. As these vitamins cannot be stroed in the body consumption of them on daily basis

eg:- vitamin A, B, C etc.

fat Soluble vitiamins:- fat soluble vitamins get dissolved in lipids mainly these vitamins get absorbed in intestinal. body can store fat soluble vitamins. In modeate limits they help the body in different Metabolism but when they exceed the limits causes hyper vitaminosis and when they lack causes hypo vitaminosis can be caused by fat soluble vitamins only.

Hormones:- Hormones are body chemical messengers they travel in the blood stream to tissue or organs. they work slowly overtime and effect many different processes including growth & development, metabolism, produced by glands in multi-cellular organisms that are transported by the circulation sysstem to target distant organs to regulate physiology and behaviour.

ex:- Testosterone, Insulin, Estrogen, oxylocin etc .

→ Polar drugs are easily distributed than non Polar drugs.

Distribution of drugs from blood stream to Effector Site :-

When the drug is administrated either by intra Vascular injection or by absorption from any of the various extra cellular sites, drug is subjected to different distribution process to lower the plasma concentrate.

Drug distribution is reversible transfer of a drug b/w one compartment to another.

Plasma - protein binding :- The binding of drugs to Plasma Protein is reversible compunds can bind to albumin α - 1 - acid glycoprotein (AGP) or lipoprotein in blood.

→ Binding to plasma protein can effect the pharma Cokinetics of the drug Substances.

Protein + Drug $\rightleftharpoons$ Drug - protein complex.
Only the part of drug which is unbound to protein can show activity.

Eu). warfarin drug is used to prevents Colotting of blood. Which is 97% bound to protein, remaining 3%. unbounded drugs shown action.

→ If the bonding b/w drug and plasma protien is less, then drug can easily travel or diffuse into the cell.

Factors affecting drug distribution:-
1. Blood-flow rate.
2. Molecule Size
3. Polarity.
4. Binding to Serum Proteins forming Complex.

Metabolism:-
Initial drug consumed will be converted into new compound and this process is called as "Metabolism". Compounds begin to break down as soon as they enter the body. Drug Metabolism is carried out in liver by redox Enzymes for majority of Small molecule Metabolities are pharmacologically inert.

i) Phase-I - rxn (Non-Synthetic (or) Non-conjugative Phase):-

Drug transforms by the process of oxidation reduction and hydrolysis in presence of enzymes the change in drug molecule generally result in introduction of a functional group molecule or the exposure of a new functional group molecule Small polar functional group like -OH, NH₂, -SH, -COOH etc. age either added or unmasked on the lipid Soluble drug, so that the resulting product may undergo Phase-I reaction.

→ Phase I rxn results in activation, change or inactivation of drug.

ii) Phase II reaction (Synthetic phase):

This is the last step in detoxification reaction and almost always results in loss of biological activity of a compound this may be process by One or more of phase one rxn this involves conjugation of a functional group of molecules with hydrophilic endogenous substances.

" Formation of conjugation" these are form with Endogenous substances such as carbohydrates and amino acids with drugs or it's metabolities formed in phase-I rxn. In this phase rxn attachment of small polar endogenous molecules like gluconic acid, Sulphate Methyl, amino acids etc. to either Unchanged drugs or phase I products. these are called as "conjugates", and these are water Soluble metabolities, which are readily Excreted from body.

Elimination / Excretion:-

Unsed, Modified Metabolities and toxic remains are removed from the body by the way of excretion generally Elimination is through Urine or in Excreta Some of these compounds Expelled. through lungs by Exhaling Sweating. otherwise.

Q) Determination of composition of complex by continuous variation method (or) JOB's method.

JOB's Method :

Job's method is used to determine the composition of a complex. Different experiment steps are involved in this process are.

(i) Prepare ten solutions in ten different test tubes of a fixed volume of the complex.

(ii) In each test tube different amounts of metal and ligands are to be taken.

(iii) Let the total no. volume of the complex prepared in each of the ten solutions is 10ml.

S. NO.	①	②	③	④	⑤	⑥	⑦	⑧	⑨	⑩
Volume of metal ion (ml).	0	1.	2	3	4	5	6	7	8	9
Volume of ligand (ml)	10	9	8	7	6	5	4	3	2	1.

The sum of the concentrations of the ligand (C_L) and metal (C_M) is constant.

Concentration of metal ion = C_M.

Concentration of ligand = C_L.

Concentration of complex (c) = $C_L + C_M$ $\longrightarrow$ ①

(iv) The optical density (absorbance) of each of the solutions is measured by Spectrophotometer.

(v) Values of mole fraction of ligand are plotted against the optical density (absorbance) of Solution.

$\longrightarrow$ Max-absorbance

$(x = \frac{C_2}{C})$
Mole fraction $\longrightarrow$

Now, if the formula of the complex is ML_n, then.

$$n = \frac{C_L}{C_M} \longrightarrow ②$$

divide the equation (1) by 'c'.

$$\frac{C_L}{C} + \frac{C_M}{C} = \frac{\cancel{C}}{\cancel{C}}$$

$$\frac{C_L}{C} + \frac{C_M}{C} = 1 \longrightarrow ③$$

But $\dfrac{C_L}{C} = x$ (mole fraction) $\longrightarrow$ ④.

Substitute ④ in ③

$$x + \dfrac{C_M}{C} = 1$$

$$\dfrac{C_M}{C} = 1 - x \longrightarrow ⑤$$

doing $\dfrac{④}{⑤}$

$$\dfrac{\dfrac{C_L}{C}}{\dfrac{C_M}{C}} = \dfrac{x}{1-x}$$

$$\dfrac{C_L}{C_M} = \dfrac{x}{1-x} \longrightarrow ⑥$$

Acc. to equation-(2) $\dfrac{C_L}{C_M} = n$; when written in equation-(6).

$$\boxed{n = \dfrac{x}{1-x}}$$

based on 'n' value. it can be possible to determine the composition of complex.

Limitations:-

(1) It gives un reliable results when more than one complex is formed in the system.

(2) It is applicable when there is no change in volume on mixing the solution of the metal ion and the ligand.

Q) Derive the rate constant equation for first order reaction.

The relations whose rate is determined by the change of only 1 concentration term are known as 1st order reaction.

$$A \longrightarrow products$$
at $t = 0$; a 0

after time `t' is ; $a - x$ 0

rate of reaction $\propto$ (reactants)^n ; here $n = 1$

$$\gamma = \frac{dx}{dt} \qquad \frac{dx}{dt} \propto (a-x)^1$$

$$\frac{dx}{dt} = k_1(a-x)$$

Where

k_1 = first order rate constant

$$\frac{dx}{(a-x)} = k_1 \cdot dt$$

on integrating the above equation

$$\int_0^x \frac{dx}{(a-x)} = k_1 \int_0^M dt$$

$$-[\ln(a-x)]_0^M = k(t)_0^t + C$$

$$-\ln(a-x) = kt + C \longrightarrow \textcircled{1} \text{ where } C = \text{integration constant}$$

when $t = 0$; then $x = 0$; Sub in equation — $\textcircled{1}$

$-\ln(a-0) = k(0) + c$

$-\ln a = 0 + c$

$-\ln a = c \rightarrow ②$

sub eq ② in ①

$-\ln(a-x) = kt - \ln a$

$\ln a - \ln(a-x) = k_1 t$

$\ln \frac{a}{a-x} = k_1 \cdot t$ ∵ $\ln \frac{a}{b} = \ln a - \ln b$

$k_1 = \frac{1}{t} \ln \frac{a}{a-x}$

but, $\ln = 2.303 \log$

$k_1 = \frac{2.303}{t} \log \frac{a}{a-x}$

i) Units:-

$k_1 = \frac{2.303}{t} \log \frac{a}{(a-x)}$

$k_1 = \frac{2.303}{sec} \cdot \log$

$k_1 = sec^{-1}$

Half life:- The time taken to complete 50% of a reaction called half life

$K_1 = \frac{2.303}{t} \log \frac{a}{(a-x)}$

When $t = t_{1/2}$; then $x = \frac{a}{2}$

$k_1 = \frac{2.303}{t_{1/2}} \log \frac{a}{(a-x)}$

$k_1 = \frac{2.303}{t_{1/2}} \log \frac{a}{\left(\frac{a}{2}\right)}$

$k_1 = \frac{2.303}{t_{1/2}} \log 2$

$$\log_? = 0.3010$$

$$k_1 = \frac{2.3010}{t\frac{1}{2}} \times 0.3010$$

$$k_1 = \frac{0.693}{t\frac{1}{2}}$$
$$t\frac{1}{2} = \frac{0.693}{k_1}$$

∴ for a first order reaction, half life is independent on the initial concentration of reactions.

Graph :-

∵ When a graph is plotting between $\log\left(\frac{a}{a-x}\right)$ and 't' the line is passing through origin. Then the slope is equal to $\frac{k}{2.303}$

$$slope = \frac{k}{2.303}$$

$$\log\frac{a}{(a-x)}$$
ii) When a graph is plotting $\log(a-x)$ against t shape is equal to $-\dfrac{k}{2.303}$.

$\log(a-x)$ $\Big\}\log a$ $-k/2.303$

Energy profile diagram of SN^1

$B+$ $B-2$

Potential energy

$R_3C(+) \overset{\ominus}{+} x \longrightarrow$ Intermidiate

$(R_3C-x)+OH^{\ominus}$
Reactant

$(R_3(-OH))$ product

progress of Reaction

→ The energy profile diagram shows two transitinal stage with carbocation as intermediate

→ In the first step Ionization of alkyl halide result in the formation of carbocation

→ It is Highly endothermic and it requires High activation energy

→ Due to high activation energy it is a slow step Hence the rate the reaction depends upon the step.

→ In the second step (or) second transitinal stage the nucleiophyle attack the carbocation is highly exothermic It has low activation energy so it is the first step.
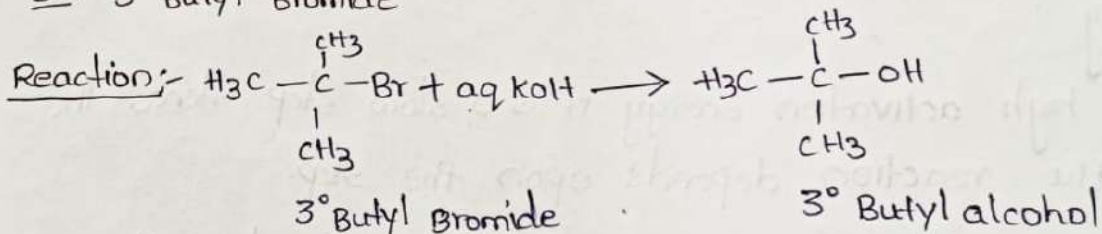

Stereo chemistry SN^1 reaction

SN^1 reaction the carbo cation produced the carbocation is sp2 hydridised due to these reason the nucleiophyle is attacked

to the carbocation towards the left side are towards
right side and produced resemic mixture ... The
compounds are non super impossible mirror image these are
called as enantiomers.

→ 50% Dextro and 50% Levo mixture is called as
Recemic mixture.

Recemic Mixture

EI: 3° Butyl Bromide

Reaction:-
$$H_3C - \overset{\overset{\displaystyle CH_3}{|}}{\underset{\underset{\displaystyle CH_3}{|}}{C}} - Br + aq\ koH \longrightarrow H_3C - \overset{\overset{\displaystyle CH_3}{|}}{\underset{\underset{\displaystyle CH_3}{|}}{C}} - OH$$

3° Butyl Bromide   3° Butyl alcohol

Mechnism:-

step 1 :
$$H_3C - \overset{\overset{\displaystyle CH_3}{|}}{\underset{\underset{\displaystyle CH_3}{|}}{C}} - Br \underset{\substack{Rate \\ determinating \\ step}}{\overset{slow\ step}{\rightleftharpoons}} H_3C - \overset{\overset{\displaystyle CH_3}{|}}{\underset{\underset{\displaystyle CH_3}{|}}{C}}\oplus$$

step 2 :-
$$H_3C - \overset{\overset{\displaystyle CH_3}{|}}{\underset{\underset{\displaystyle CH_3}{|}}{C}}\oplus \overset{Fast\ step}{\underset{\ominus OH}{\longrightarrow}} H_3C - \overset{\overset{\displaystyle CH_3}{|}}{\underset{\underset{\displaystyle CH_3}{|}}{C}} - OH$$

→ Penta Territary Butyl Bromide react with aquorous ptossium hydroxide and produce teritary Butylal alchol

→ This reaction takes place in the presence of protete solvent.

→ In this Reaction low consentration nucleiphyle

→ This Reaction takes place in two steps.

→ In the 1st place teritary butyl bromide is converted to teritary carbocation in the slow step and late determin-ing step.

• The rate of the reaction depending upon the concentration of teritary butyl bromide so it is called as rate determining step.

• In step 2 unstable carbocation is react with low concentration nucleiophyle in the test step and produce and teritary alochol and butyal alchol

$$\text{Rate} \propto \left[H_3C - \overset{\overset{\displaystyle CH_3}{|}}{\underset{\underset{\displaystyle CH_3}{|}}{C}} - Br \right]$$

(or)

$$\text{Rate} \propto \left[3° \text{ Butyl Bromide} \right]$$

Interhalogens :-

→ Each halogen can combine with other halogen under suitable conditions to form a new type compounds know as inter halogen compounds (or) inter halogens.

→ General formula of inter halogen compounds in AX_a

-A = less EN halogen X = more EN halogen

classification :-

Inter halogen are classified into 4 types

AX, AX_3, AX_5, AX_7

AX	AX_3	AX_5	AX_7
ICl	ICl_3	IF_5	IF_7
ClF	ClF_3	BrF_5	
BrF	BrF_3		
BrCl	—		
IF	—		

preparation :-

① Direct combination :-

By the direct combination the two halogens to form inter halogen compounds.

$$CI_2 + F_2 \xrightarrow{200°C} 2ClF$$

$$I_2 + Cl_2 \longrightarrow 2ICl$$

$$Cl_2 + 3F_2 \xrightarrow{300°C} 2ClF_3$$

$$Br_2 + 3F_2 \longrightarrow 2BrF_3$$

$$Br_2 + 5F_2 \longrightarrow 2BrF_5$$
Indirect Method :-

By the action of a halogen on a lower inter halogen to form another inter halogen compound.

$$IF_5 + F_2 \xrightarrow{200-300°C} IF_7$$

$$ICl + Cl_2 \longrightarrow ICl_3$$

1) Flourescence life time and Flourescence Quenching?

Flourescence life time (FLT) is the time a flourophere spends in the excited state before emitting a photon & returning to the ground state.

FLT can vary from pico seconds to hundreds of Nanoseconds depending on the flourophere. FLT is not an intinsic property of a flourophere, FLT does not depend upon flourophere concentration, absorption by the sample, sample thickness, method of measurment. The flourescence life time is calculated by the following equation.

$$\tau = 1/k_f + k_{nr}$$

τ = Flourescence life time.

k_f = Radiative decay rate

k_{nr} = Non Radiative decay rate.

Flourescence Quenching:- Decrease of flourescerce intensity by interaction of the excited state of the flouresphere with it's surrangs is known as Quenching. It is classified into 3 types i.e

1) Collision/Dynamic Quenching:- In this process collision returns flourophere to Ground state without photon emission

2) Static Quenching:- In this process excited state compounds or e⁻ formed as a complex non flouroscent material.

3) Apparent Quenching :- Turbidity optical density of flour Exc phore caused for this type of Quenching the

2) Write the Applications of Flourescence · spectroscopy ?. E

Ans) ① Indicator for DNA Hybridisation :- In DNA Hybridisation Gd flourophore and quencer molecules become attached to qu ends of single strand DNA & close to one another causing is a loop. As DNA becomes hybridised & attaches to another single strand DNA chain the flourophore quencher complex is cleaved allowing for the flourophore to generate light.

② DNA Interaction with metal ion :-

Interaction of DNA with metal ions also identified with the help of flourence Quenching Ex :- The ends of short DNA fragment connected with a flourescent dye & quencher through a covalent bond; are divided in a solution. The dye is producing light.

③ DNA Interaction with drugs :-

The effective interaction of drugs with DNA, usually causes a significant en ancement of the flourescence intensity as a consequen of different factors. Thus in the case of interchelating drugs the molecules are inserted into the base stack the helix.
write about carbazole?
## Synthetic methods :=

1) from Biphenyl :=

Red. hot tube

2) from diphenyl :=

250°C
pyrolysis

pyrolysis
$-H_2O$
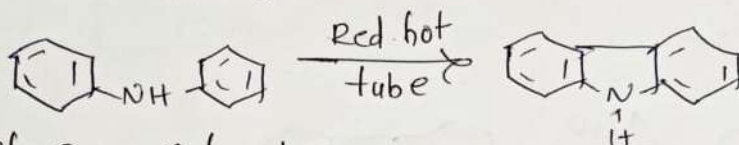

2-hydroxy carbazole.

3) from phenanthrene derivative :=

4,5, dinitro 9,10. dione phenanthrene.

$KMnO_4$

SD/HCl.

Δ.
$2CO_2$
$-NH_3$
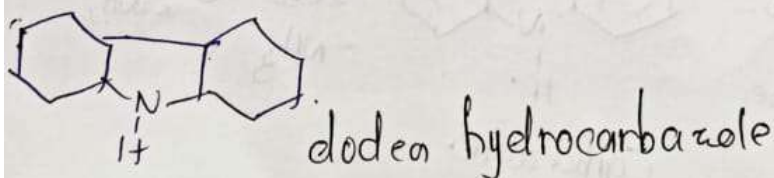

Carbazole.

properties :=

➤ carbazole is a solid, 245-247° C — Melting point.

➤ It is an aromatic compound.

➤ Is Resonance energy 74 k·cal.

➤ N-H bond carbazole shows acetic property and its reacts with Grignard reagent.
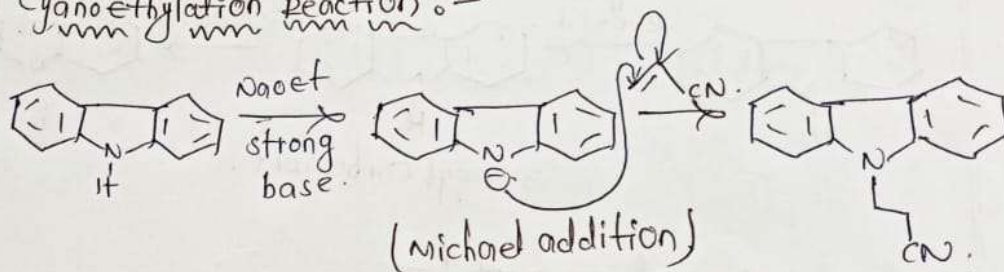

oxidation :=

Ag₂O →   N,N [or] 9,9 dicarbazole.

↓ Na₂Cr₂O₇.

3,3 dicarbazole.

Reduction :=

Na/EtOH →   Sn/HCl →   - Hexa hydro carbazole

↓ Ni/H₂

dodeca hydrocarbazole
N-substitutions Reactions :—

N-Methyl carbazole.

$R-\overset{O}{\underset{||}{C}}-Cl /OH^\ominus$.

Cyanoethylation Reaction :—

(michael addition)

$\sigma[\beta$-cyanoethyl carbazole]

## electrophilic substitution reactions :—

→ The carbazole is an Aromatic compound. an undergoes. electrophilic substitution reactions.
→ $e^\oplus$ attacks at 3,6th positions .

Halogenation :—

3-bromo carbazole.   3,6 dibromo. carbazole .

MICROBIOLOGY

ASSIGNMENT

NAME :- VUSHAKOYALA NAVYA

COURSE :- B₁·M₁·Z

SEM :- VI

HALL TICKET No. :- 086223810

TOPIC :- WATER-BORNE DISEASES

WATER-BORNE DISEASES

Protozoa :-

Disease & Transmission	Microbial Agent	Source of Agent in Water Supply	General Symptoms
Acanthamoeba Keratitis (Cleaning of contact lenses with contaminated water)	Acanthamoeba (A. castellanii & A. polyphaga)	Widely distributed free living amoeba found in many types of aquatic environments, including surface water, tap water, swimming pools, & contact lens solutions.	Eye pain, eye redness, blurred vision, sensitivity to light, sensation of something in the eye & excessive tearing.
Amoebiasis (hand – to – mouth)	Protozoan (Entamoeba histolytica) (Cyst-like appearance)	Sewage, non-treated drinking water, flies in water supply, saliva transfer	Abdominal discomfort, fatigue, weight loss, diarrhea, bloating, fever.
Cyclosporiasis	Protozoan parasite (Cyclospora cayetanensis)	Sewage, non-treated drinking water.	Cramps, nausea, vomiting, muscle aches, fever & fatigue.
Naegleriasis (primary amoebic meningoencephalitis [PAM]) (Nasal)	Protozoan (Naegleria fowleri) (Cyst like-appearance)	Water spots, non-chlorinated water	Headache, vomiting, confusion, loss of balance, light sensitivity, hallucinations, fatigue, weight loss, fever & coma.

3

Microsporidiosis	Protozoan Phylum (Microsporidia)	Encephalitozoon intestinalis has been detected in ground water, but closely related to origin of drinking water. Fungi	Diarrhea & wasting in immunocompromised individuals.

Bacteria:-

Disease & Transmission	Microbial Agent	Source of Agent in Water Supply	General Symptoms
Campylobacteriosis	Most commonly caused by Campylobacter jejuni species.	Drinking water contaminated with feces.	Produces dysentery like symptoms along with a high fever usually last 2-10 days.
Otitis Externa (Swimmer's ear)	Caused by a number of bacterial & fungal species.	Swimming in water contaminated with responsible pathogens.	Ear canal swells, causing pain & tenderness to the touch.
Salmonellosis	Caused by many bacteria of genus Salmonella.	Drinking water contaminated with the bacteria. More common as a food borne illness.	Symptoms include diarrhea, fever, vomiting & abdominal cramps.
Dysentery	Caused by a no. of species in the genera Shigella & Salmonella with most common	Water contaminated with the bacterium	Frequent passage of feces with blood &/or mucus & in some cases vomiting of blood.

Microsporidiosis	Protozoan phylum (Microsporidia Microsporidia) but closely related to fungi	Encephalitozoon intestinalis has been detected in ground water, the origin of drinking water	Diarrhea & wasting in immunocompromised individuals.

Bacteria :-

Disease & Transmission	Microbial Agent	Source of Agent in Water Supply	General Symptoms
Campylobacteriosis	Most commonly caused by Campylobacter jejuni species.	Drinking water contaminated with faeces.	Produces dysentery like symptoms along with a high fever usually last 2-10 days.
Otitis Externa (Swimmer's ear)	Caused by a number of bacterial & fungal species.	Swimming in water contaminated with responsible pathogens.	Ear canal swells, causing pain & tenderness to the touch.
Salmonellosis	Caused by many bacteria of genus Salmonella.	Drinking water contaminated with the bacteria. More common as a food borne illness.	Symptoms include diarrhea, fever, vomiting & abdominal cramps.
Dysentery	Caused by a no. of species in the genera Shigella & Salmonella with most common	Water contaminated with the bacterium	Frequent passage of feces with blood &/or mucus & in some cases vomiting of blood.

Acute Gastroenteritis (AGI) (fecal-oral, spread by food, water, person to person & fomites)	Norovirus	Enters water through the feces of infected individuals	Diarrhea, vomiting, nausea, stomach pain.
Poliomyelitis (Polio)	Poliovirus	Enters water through the feces of infected individuals.	90-95% of patients show no symptoms, 4-8% have minor symptoms with delirium, headache, fever & occasional seizures & spastic paralysis, 1% have symptoms of non-paralytic aseptic meningitis. The rest have serious symptoms resulting in paralysis or death.
Polyoma Virus infection.	Two of polyoma: JC virus & BK virus.	Very widespread, can manifest itself in water, ~80% of the population has antibodies to polyomavirus.	BK virus produces mild respiratory infection & can infect the kidneys (BK virus immunosupressed transplant patients). JC virus infects the respiratory system, kidneys or can cause progressive multifocal leukoencephalopathy in the brain (which is fatal)

Leptospirosis	Caused by bacteria of genus *Leptospira*	Water contamination by the animal urine carrying the bacteria	Begin with flu like symptoms then resolves. The second phase then occurs involving meningitis, liver damage (causes jaundice) & kidney failure.

being *Shigella dysenteriae*

Viruses:-

Disease & Transmission	Viral agent	Source of Agent in Water Supply	General Symptoms.
Hepatitis-A	Hepatitis-A Virus (HAV)	Can manifest itself in water & food	Symptoms are only acute & include fatigue, fever, malaise, abdominal pain, nausea, diarrhea, weight loss, itching, jaundice & depression.
Hepatitis E (Fecal-Oral)	Hepatitis-E virus	Enters water through the feces of infected individuals	Symptoms are of acute hepatitis like disease, including fever, fatigue, loss of appetite, nausea, vomiting, abdominal pain, jaundice, dark urine, clay-coloured stools & joint pain.

Microsporidiosis.		Protozoan Phylum (Microsporidia) but closely related to fungi	Encephalitozoon intestinalis has been detected in ground water, the origin of drinking water	Diarrhea & wasting in immunocompromised individuals.
Bacteria :-				
Disease & Transmission		Microbial Agent	Source of Agent in Water supply	General Symptoms
Campylobacteriosis	Most commonly caused by Campylobacter jejuni	Drinking water contaminated with feaces.	Produces dysentery like symptoms along with a high fever usually last 2-10 days.	
Otitis Externa (Swimmer's ear)	Caused by a number of bacteria & fungal species.	Swimming in water contaminated with responsible pathogens.	Ear canal swells, causing pain & tenderness to the touch.	
Salmonellosis	Caused by many bacteria of genus Salmonella.	Drinking water contaminated with the bacteria. Note common as a food borne illness.	Symptoms include diarrhea, fever, vomiting & abdominal cramps.	
Dysentery	Caused by a no. of species in the genera Shigella & Salmonella with most common	Water contaminated with the bacterium	Frequent passage of feces with blood &/or mucus & in some cases vomiting of blood.	

WATER-BORNE DISEASES

Protozoa:-

Disease & Transmission	Microbial Agent	Source of Agent in Water Supply	General Symptoms
Acanthamoeba keratitis (Cleaning of contact lenses with contaminated water)	Acanthamoeba (A. castellanii & A. polyphaga)	Widely distributed free living amoeba found in many types of aquatic environments, including surface water, tap water, swimming pools, & contact lens solutions.	Eye pain, eye redness, blurred vision, sensitivity to light, sensation of something in the eye & excessive tearing.
Amoebiasis (hand-to-mouth)	Protozoan (Entamoeba histolytica) (Cyst-like appearance)	Sewage, non-treated drinking water, flies in water supply, saliva transfer	Abdominal discomfort, fatigue, weight loss, diarrhea, bloating, fever.
Cyclosporiasis	Protozoan parasite of Cyclospora cayetanensis	Sewage, non-treated drinking water.	Cramps, nausea, vomiting, muscle aches, fever & fatigue.
Naegleriasis (primary amoebic meningoencephalitic [PAM] (Nasal)	Protozoan (Naeglesia fowleri) (Cyst like-appearance)	Water spots, non-chlorinated water	Headache, vomiting, confusion, loss of balance, light sensitivity, hallucinations, fatigue, weight loss, fever & coma.

Student Assignment

Name of the department - Microbiology

Class : Bsc (Micro biology) I sem

No. of students : 78

Name of the topic :- Intrinsic & Extrinsic parameters
that affects the growth of micro organisms

Total no. of students submitted :- 74

G. Chandrakala

Principal
VAAGDEVI DEGREE & P.G. COLLEGE
Kishanpura, Hanamkonda

• Intrinsic and Extrinsic properties

Intrinsic Factors

M.O's can grow in a wide range of pH. The variations in pH values for growth may be due to different strains of a species or different species in a genus. There is an inter relationship b/w pH and other environmental factors. There is pH of the substrate also influence the activity of enzyme systems and the products of metabolism of M.O's

1) pH of food :

The pH of a food along with other environmental factors will determine the types of M.O's that are able to grow and dominate and eventually cause spoilage by a desired fermentation on a potential health hazard. The pH of a food is determined by the acid or alkaline substances. The pH of the food products can change during ripening processing or storage.

Example :

Egg white : This is one of the most alkaline biological substances. The albumin of or freshly laid chicken has a pH approximately of 7.6 when the egg is stored in store room the CO_2 from carbonic acid in the albumin is released through the egg shell. When this occurs pH levels are associated with thinning of albumin and a dec in egg quality. egg quality is maintained at a albumin pH near 8.2. Storage in an atmosphere of CO_2 or oiling the egg shell maintains the pH at a intermediate level.

Red Meat : The pH of the living animal tissue is near to neutral. The circulating blood brings nutrients and oxygen to the cells and remove the waste products of

moisture until equilibrium has been established. Some foods with established life lose general high and loose moisture when placed in an environment at low relative humidity. In general the higher the temp, the lower the temp, the higher the relative humidity.

Foods that undergo surface spoilage from molds, yeast and certain bacteria should be stored under conditions of low relative humidity. It is possible to lessen the chances of surface spoilage of certain foods by storing under low conditions of relative humidity. It should be remembered that the food itself looses the moisture to the atmosphere under such conditions and there by become undesirable.

3. presence and conc. of gases in the environment:

The storage of food in atmosphere containing increased amounts of CO_2 upto 10% is reffered to as controlled atmosphere or modified atmosphere storage. The conc. of CO_2 generally does not exceed 10% and is applied either from mechanical source or by the use of dry ice. CO_2 has been shown to effect the fungal rotting of fruits caused by a large variety of fungi. Ozone is effective against a variety of m.o's both CO_2 and O_2 are effective against m.o's regarding the surface spoilage of beef under long storage.

iii). Mesophiles: The organisms that grow well b/w 20°C to 45°C with optimum b/w 30°C and 40°C are refferred to as mesophiles.

The Psychrophiles are found most commonly on food are those that belong to the genera pseudomonas and enterococcus. These organisms grow well at refrig-nated temperature and cause spoilage of meat, fish, poultry eggs and other food normally held at this tempera-ture. The mesophilic orgnism mainly cause spoilage of food that is placed at room temperature most thermophilic bacteria of importance in foods belong to, genera bacillus and clostridium. These are of great intrest to the food microbiologist and food technologist in the canning industry.

The quality of food product must also be taken into account in selecting a storage temp or Bananas are better it stored at 17°C. A large no. of vegetables are stored at a temp at about 10°C including potatoes cabbage etc. Temperature of storage is the most important parameter that effects the spoilage of highly perishable foods.

2. Relative humidity of storage and environment:

The relative humidity of storage environment is important both from. The stand point of aw in foods and growth of M.O's at the substances.

When foods with low aw values are placed in environment of high relative humidity, the foods pickup

Biological structures:

The natural covering of some foods provide excellent protection against the entry and subsequent damage by spoilage organisms. In this category are testa of seeds the outer covering of fruits. The shells of egg etc. The strain covering of fish and meat such as beef and pork prevents the contamination and spoilage of th foods.

Extrinsic factors:

The extrinsic factors of foods are those properties of the storage environment that effect both the foods and their M.O's the parameters are.
1. Temperature of storage
2. Relative humidity of environment
3. presence and conc. of gases in the environment

1. Temperature of storage:

M.O's grow over a wide range of temperature the lowest temp at which M.O's have been reported to grow is 34°c and the highest is 90°c. The M.O's are grouped into three types based on their temp requirme

i) Psychrophiles: The organisms that grow well or b/w: and 20°c are reffered to as psychrophiles.
Thermo

ii) Mesophiles: The organisms that grow well above 45°c with optimum temp blw. 55°c and 65°c are reffered to us thermophiles

taxtion on the atmosphere.

Nutrient content

In order to grow M.O's require the following
i) water ii) Source of energy
iii) Source of H_2
iv) vitamins and related growth factors
v) Minerals

Microorganism can grow only in aqueous sol"
They cannot grow in pure water or in the absence of
water dissolves many substances than any other solvent.
water is involved in the chemical reactions that break
down substrate to usable molecules. As sources of energy
food borne m.o's may utilize carbohydrates such as starch
and cellulose m.o's require B-vitamin in low quantities
certain elements or minerals found in glucose cellulose
components are needed in trace elements by M.O's Na, k, ca
and Mg are needed in large amounts.

Antimicrobial constituents

The stability of some foods against the attack
by m.o's is due to the presence of certain naturally occurring
substances that have been have shown to have antimicrobial
activity some species are known to contain essential oils that
possess antimicrobial activity.

Among these Eugenol in cloves allicin in garlic,
cinnamic aldehyde and Eugenol in cinnamon cows milk contain
Several antimicrobial substances including Lactofucin conglu
-tinin eggs contain Lycozyme which possess antimicrobial
activity

15

metabolism when an animal is slaughtered blood no longer circulates anaerobic conditions develop and metabolic products accumulate. The inherant tissue enzymes ferment the muscle glycogen to lactic acid which lowers the pH.

Immediately after slaughtering. The pH of beef muscles is 6.9 to 7.2. The pH of most pork muscle is from 5.8 to 5.6 microbiologically. low pH containing food is the desired one. The pH (containing food is the) for the growth of pseudomonas that spoil meat is 5.6 if meat has an ultimate pH. less than 5.6 it would be expected to have longer life.

Chicken :

The pH of the chicken muscles, varies similarly to that of red meat, slaughtered chicken has a pH of 5.5 to 5.9

Sea food :

The pH of fish (7.0 - 7.3) is lowered to pH 5.5 - 6.5, depending on the species of fish and the initial amount of glycogen in the muscles. The pH of the canned crab is usually pH 6.8 - 7.4 and pH of brown shrimp is 7.1 - 8.4

Fruits and vegetables :

Fruits generally have a lower pH. fruits, generally have a lower pH than ripe fruits the ripening important influence the ultimate pH. The only of fruit influence not only the growth of M.O's but also quality factors. Such as softening and discolouration of canned foods. Since, the pH is low. fruits are usually spoiled by mould growth vegetables. Usually have a higher pH than fruits and are subjected to bacterial spoilage.

b) Moisture content :-

Some M.O's can remain alive in a dried condition but cannot carry out their normal metabolic activities or multiply without water. dissolves more substances than any other solvent. The water requirements of M.O's defined in terms of water activity (aw).

Water activity (aw) is defined as the vapour pressure of a solution divided by the vapour pressure of a solvent. The value of water activity range from 0 to 1. The escape of water to the our is measured by the equilibrium relative humidity (E.R.H)

$$a_w = \frac{P}{P_0} = \frac{ERH}{100}.$$

Water activity and microbial growth. M.O's hav an max., opt. and, aw for growth. Since the aw of pure water is 1.00 and M.O's cannot survive in pure water. The max or upper limit for microbial growth is an aw some what less than 1.00. The aw of most fresh foods is above 0.99 in general, for growth bacteria require higher aw than yeast and yeast require a higher aw than molds. otly aspects of aw are also important. These aspects include th germination of spores toxin production resistant to heat.

Most oftenly high. aw is required for sporulation than germination. The production of enterotoxin by 3 acres requires a high aw than that for growth. The lower. the aw the longer the M.O's survive during storage.

Water activity of food :-

The aw of food can be lowered by removing water. by adding solutes or by freezing fresh foods. Such as Fruits. vegetables. meat, poultry and Fish have aw values of 0.98-

... which will allow the growth the most M.O's on products that have low aw due to sugar products (jam, jellies or honey) will be subjected to attack by osmo--philic yeasts while products that contain high salt con. will be spoiled by halophillic bacteria. Fried foods ge--rally have a aw values below 0.75. A safe aw level of storage is usually considered to be 0 to 0.01 less in protected by low aw enzymatic changes can occurs but a slow rate.

Oxidation - Reduction potential :

When a substance is oxidised it, loss $e^{-}s$, these $e^{-}s$ must be accepted by another substance which then becomes reduced. The oxidation - reduction potential a system is expressed by the symbol 'Eh'. E h is to meas--re the intensity not the capacity of the system.

Effect on M.O'o :

The microbial cultures the simultaneous oxida--tion and reduction are the sources of energy for cell process. Since energy is needed by the cell to functio

Strictly aerobic M.O's grow only in the pres--nce of free atmospheric O_2. strictly anaerobic organism survive and include only in the absence of free O_2 facultative anaerobes can grow with/without free O_2, micro aerophilic org's cannot multiply in either entirely aerobic anaerobic conditions. They grow best in a limited amor of O_2.

Redox potential of Foods :

The oxidation - reduction potential of Food depends upon the composition: The ...

H.T.No:

General Microbiology.

→ **Ultra Structure of Prokaryotic cells:**

Prokaryotic cell envelope consists of several layers:

1. **Glycocalyx(or slime layer):** A loose, gelatinous layer composed of polysaccharides and proteins. It helps protect the cell from desiccation and provides some protection against phagocytosis.

2. **Peptidoglycan (or Murein) Layer:** A rigid layer composed of peptidoglycan (a polymer of sugars and amino acids). This layer provides structural support, maintains the cell's shape and prevents the cell from bursting due to osmotic pressure.

3. **Outer Membrane (OM):** A phospholipid bilayer containing various proteins, including porins, which facilitate the transport of molecules across the membrane. The OM is present in Gram-negative bacteria.

Prokaryotic Cell Membrane:

The prokaryotic cell membrane also known as the plasma membrane, is a phospholipid bilayer that surrounds the cell's cytoplasm. It:

1. Regulates the movement of molecules: Controls the transport of ions, nutrients, and waste products across the membrane.

2. Maintains cellular homeostasis:
Regulates the cell's internal environment, including pH, temperature, and osmotic balance.

3. Provides structural support:
Helps maintain the cell's shape and provides a platform for the attachment of various proteins and other molecules.

Cytoplasm and Cytoplasmic Inclusions:

The cytoplasm is the region between the cell membrane and the nucleoid. It contains:

1. Cytoplasmic matrix: A gel-like substance composed of water, salts, sugars and various organelles.

2. Ribosomes: Small organelles responsible for protein synthesis.

3. Inclusions: Specialized structures that perform specific functions such as:

o Mesosomes: Infoldings of the cell membrane that may be involved in cellular respiration or DNA replication.

o Magnetosomes: Membrane-bound structures containing magnetite crystals, which help magnetotactic bacteria orient themselves in magnetic fields.

o Gas Vesicles: Protein-bound structures that provide buoyancy, allowing some bacteria to float or maintain their position in water columns.

Nucleoid:

The nucleoid is the region where the prokaryotic cells genetic material (DNA or RNA) is located. It:

1. Lacks a nuclear membrane: Unlike eukaryotic cells, prokaryotic cells do not have a nuclear membrane surrounding their genetic material.

2. Contains a single circular chromosome: Most prokaryotes have a single circular chromosome, although some may have multiple chromosomes or plasmids.

3. May contain plasmids: Plasmids are small, self-replicating circular DNA molecules that can carry additional genetic information.

Other Ultrastructural Features:

Other notable ultrastructural features of prokaryotic cells include:

1. Pili (or Fimbriae): Short, hair-like structures that facilitate attachment to surfaces, DNA transfer or motility.

2. Flagella: Long, whip-like structures that provide motility.

3. Cell wall appendages: Structures like S-layers, which provide additional protection and support.

PROKARYOTIC CELLS	EUKARYOTIC CELLS
1. Lack a true nucleus: Genetic material (DNA & RNA) is found in a single circular chromosome in the nucleoid region.	1. True nucleus. Gentic material (DNA) is found in a membrane-bound nucleus.
2. No membrane - bound organelles: No mitochondria, chloroplasts, or other membrane -bound organelles.	Membrane bound organelles: Contain various organelles, such as mitochondria, chloroplasts & a golgi apparatus.
3. Small size Typically 1 - 10 um in diatmeter	3. Large size: Typically 10-100 um in diameter.
4. Simple cell structure: Lack a cytoskeleton and the cell wall is composed of peptidoglycan (in bacteria).	4. Complex cell structure: Have a cytoskeleton & the cell wall is composed of cellulose (in plants) or chitin (in fungi).
5. Rapid cell division: Can divide rapidly with some bacteria dividing every 20-30 minutes.	5. Slower cell division: Divide more slowly than prokaryotic cells, with some cells dividing every 24 hours.
6. Limited metabolic processes. Lack the complex metabolic processes found in eukaryotic cells	6. Complex metabolic processes. Have complex metabolic processes, including photosynthe-sis (in plants) & oxidative phosphorylation (in mitochondria)

23

Key Differences:

1. Nucleus: Eukaryotic cells have a true nucleus, while prokaryotic cells lack a nucleus.

2. Organelles: Eukaryotic cells have membrane-bound organelles, while prokaryotic cells lack these structures.

3. Cell size: Eukaryotic cells are generally larger than prokaryotic cells.

4. Metabolic processes: Eukaryotic cells have more complex metabolic processes than prokaryotic cells.

③ Define cells with its parts in detailed with the help of diagram.

⇒ CELL: A cell is the basic structural & functional unit of living organisms. It is tiny membrane-bound entity that contains the fundamental components necessary for life.

CELL COMPONENTS: A cell consists of several components, each with distinct functions.

1. Plasma membrane: A thin, semi permeable membrane (7-10 nm thick) that surrounds the cell and regulates the movement of materials in and out.
• Composed of phospholipid bilayer with embedded proteins.
• Controls the exchange of nutrients, waste, & signaling molecules.

24

2. Cytoplasm:
   - A jelly like substance inside the cell membrane where many metabolic processes take place.
   - composed of water (70-90%), salts, sugars, amino acids and various organelles.
   - Site of glycolysis, protein synthesis and other cellular activities.

3. Genetic Material (Nucleus):
   - Contains the instructions for the cell's growth, reproduction and function.
   - Found in the nucleus (eukaryotic cells) or nucleoid (prokaryotic cells).
   - Composed of DNA (or RNA in some viruses) and associated proteins.

4. Organelles: specialized structures within the cell that perform specific functions. Examples include:

a) Mitochondria: site of cellular respiration, generating energy for the cell through ATP production.

b) Ribosomes: Found in cytoplasm. Site of protein synthesis, translating mRNA into specific amino acid sequences.

c) Endoplasmic reticulum (ER):
   - Found in eukaryotic cells.
   - Involved in protein synthesis, folding & transport & lipid synthesis.

d) Golgi Apparatus:

• Found in eukaryotic cells. Contain digestive enzymes that break down and recycle cellular waste & foreign substances.

f) Chloroplast: Found in plant cells.
Site of photosynthesis, converting light energy into chemical energy.

Cytoskeleton:

• A network of protein filaments that provides structural support, shape & mechanical stability to the cell.
• Composed of microtubules, microfilaments, & intermediate filaments.

Cell Wall:

• A rigid, external layer that provides additional support and protection to the cell.
• Found in plant, bacterial & fungal cells.
• Composed of cellulose (plant cells), peptidoglycan (bacterial cells) or chitin (fungal cells).

These cellular components work together to maintain the cell's homeostasis, facilitate communication & enable the cell to respond to its environment.

Haematopoietic stem cells [HSCs]

- Haemtopoietic stem cells are also known as Blood stem cells that give rise to other blood cells, and this process is called as Haematopoiesis.

- HSCs cells give rise to different types of blood cells, called Myeloid progenitor and lymphoid progenitor.

- Myeloid and lymphoid lineages both are involved in dendritic cell formation.

- Myeloid cells include monocytes, macrophages, neutrophils, basophils, eosinophils, erythrocytes, mast cells, megakaryocytes, myeloblast and dendritic cell.

- Lymphoid cells include natural killer cells, T cells, B cells and innate lymphoid cells.

- Granulocytes gives first response.

⟶ **Myeloid Progenitor :** These cells are the precursor of red blood cells, platelets, granulocytes, monocyte, macrophages, dendritic cells, mast cells and osteoclasts.

i.] Erythrocytes [RBC]: Red blood cells referred to as Erythrocytes. It's main function is to carry oxygen from the lungs and deliver it throughout our body.

Leukocytes [WBC] : WBC referred to as leukocytes. It's main function is to carry out phagocytosis

Granulocytes: A type of immune cell that has granules with enzymes that are released during infections etc.

i.] Neutrophils :-

• Neutrophils also known as neutrocytes, heterophils / polymorpho-nuclear leukocytes are a type of white blood cell.

• They form the most abundant type and make up around 40% to 70% / 80% of all WBCs

• They form an essential part of the Innate immune system

Neutrophil.

• The average size of Neutrophil is 12 to 15 μm (or) 19 μm.

• Neutrophil is likely to first encounter a pathogen.

• Extremely good in phagocytosis.

• It has very short life span compared with other WBCs.

• It forms hair like filaments by joining 2 to 5 lobes.

• It produces puss during an infection.

• It moves like amoeba, hence it has Amoeboid movement.

ii.] Eosinophil :-
- It also called as eosinophiles (or) acidophils.
- Eosinophils make up about 1-3% of WBCs, and are about 12-17 μm in size with bilobed nuclei.
Eosinophil.

- It releases many cytokines and other chemical factors.
- It is important for wound healing and tissue repairing.
- It is less common in the blood than Neutrophil.

iii.] Basophil :-
- These cells are least common type of WBC.
- These cells are the largest granulocytes
- It represents about 0.5 - 1%

Basophil.

- It secretes cytokines & other signalling molecules.
- It has S-shaped nuclei with 2 lobes.

iv.) Mast cells :-
- Mast cells are similar to Basophils.
- But do not have multi-lobed nuclei.
- Found in connective tissue instead of circulating in blood stream. IgE

Receptor — Antigen

Degranulation

Mast cell.

Histamines

- It acts like an Alert system.
- It contains large secretory granules of Heparin, proteoglycan and anti-coagulation [blood thinner chemical]

v.) Macrophages :-
- Releases cytokines to create immune response.
- It performs phagocytosis.
- It lives on tissue under normal conditions is known as Tissue radient macrophage.
- These cells originated from foetal yolk sac.

Macrophage.
vi.] Dendritic cell :-
• These cells have capability to performs phagocytosis.
• It is found in tissue.
• It is not heavily involved in pathogen clearance.
• It can take antigen back to structure called lymphnode and activates T cells and also neutralize pathogen.

Dendritic cell.

→ lymphoid Progenitor :- These cells are differentiated into B lymphocyte, T-lymphocyte and Natural killer cell [NK]

i.] B-lymphocytes/ B-cells :-
• Its main role is to make antibody 'y' shaped protein that can bind to pathogen's.
• It blocks pathogen from entering and phagocytosis.
• It requires help from T-cells to became fully activated.
• It is a life long production process starts in foetal & bone marrow after birth.
• It is a key player in adaptive IR.

B-cells.

33
ii.] T-lymphocytes/ T-cells:-

○ CD_8 : • These are the surface proteins by dividing into CD_4 and CD_4 [culster of differentiation.]
These are expressed surface of immune cell.
• Killer T cell which kills cancerous/infected cells.

T-cell CD_8 CD_4
○ CD_4 : • These are known as Helper T cells.
• These activate B-cells and secrete cytokine.
• It guides immune response.

○ Regulating T cells : • Secretes cytokine to tone down IR
                                    overly it
and kills killer T-cells. ; it starts getting out of control.

• After encountering pathogen, B & T cells can live for years in the body. So, next time they see the pathogen and able to give strong reaction allowing the body to control infection more quickly.

iii] Natural killer cells :-
• It recognizes and kills cancer cells and virally infected cells.
• These are effective in identifying and clearing pathogen,
Natural killer cells

• But they can only recognise generalized pathogen not specific one.
• They can differentiate good & bad microbe.
• Nk cells develops in Bone marrow as well as some extra modular sites such as lymph nodes.
   ex: Thymus, liver etc.

BIOMOLECULES

CARBOHYDRATES

Carbohydrates are defined as polyhydroxy aldehydes [or] ketones [or] compounds that produce them on hydrolysis. They have a general formula of $C_n(H_2O)_n$. These definition of a carbohydrates was proposed by Gmil fisches, who is also regrated as father of shrennal Biochemistry

* IMPORTANCE :-

Carbohydrates play a major role in promoting the health fitness. They form a major part of food and help a great deal in building the body strength by generating energy. In fact, they are one among the three prominent macronutrients that serve as excellent energy provides. The functions of carbohydrates are multiple and it is owing to this fact that if becomes all the more necessary to incorporate carbohydrates in the meal. For instant energy generation, sugars and starch act as the perfect fuel that enable to carry out physical activies efficiently and effectively fiber does wonders in keeping bowel function going smooth, being fats and proteins. Carbohydrates intake can take place in different forms like sugar, starch, fibers, etc. Talking about the importance of carbohydrates apart from its direct benefits, there is also

CARBOHYDRATES

Monosaccharides

Presence of functional group
- Aldosases [CHO]
- Ketosases [C=O]

Of carbons
- Triose
  - G3P
  - DHAP
- Tetrose
  - Erythrose
  - Erythrulose
- Pentose
  - Ribose
  - Ribulose
- Hexose
  - Glucose
  - Galactose
  - Fructose
- Heptose
  - H
  - Heptose
  - Pseudoheptulose

Disaccharides
- Sucrose [Glu+F]
- Maltose [Glu+Glu]
- Lactose [Gal+Glu]

Oligosaccharides
No. of sugar units (3 to 10)
- Trisaccharides
  - Raffinose [Gal+Glu+F]
- Tetrosaccharides
  - Stachyose [Gal+Gal+Glu+F]
- Pentasaccharides
  - Verbascose [Gal+Gal+Gal+Glu+F]

Polysaccharides
- Homopolysaccharides
  - Glycogen
  - Cellulose
  - Starch
  - Chitin
- Heteropolysaccharides
  - Hyaluronic acid
  - Keratin
  - Mucopolysaccharides
  - Protoglycan
  - Dermatins

an added advantage of carbohydrate consumption in different foods, which if eaten, also pave way for consuming other essential nutrients. Therefore, it is preferable to go in for distinctive carbohydrates food sources.

Carbohydrates add on to the taste and appearance of food item, thus making the dish tempting and mouth watering. They are sometimes used as flavours and sweetness, Carbohydrates and in regulating blood glucose and also do good to the body by breaking down fatty acids, thus preventing ketones. So eat, plently of foods that are rich sources of carbohydrates, but it is recommended to go in for natural slow digesting carbohydrates

* CLASSIFICATION

Carbohydrates are often refered to as saccharides (Greek: sakcharon-sugar). They are broadly classified into three major groups.
Monosaccharides, oligosaccharides, polysaccharides. Thes categeorization is based on the number of sugar units. Mono-and oligo saccharides are sweet to taste, crystalline in character and soluble in water, hence they are commonly known as sugars.

I. Monosaccharides :- [Greet: Mono-one] are the simplest group of carbohydrates and are often referred to as simple sugars. They have the general forms formula $(C_6(H_2O))n$ and they cannot be further hydrolysed. The monosaccharides are divide d into different categories, based on the functional group and the number of carbonatoms.

Aldoses :- When the functional group in monosaccharides is an aldehyde ($-\overset{H}{C}=O$) they are known as Aldoses

ex:- Glyceraldhyde, Glucose

Ketoses :- When the functional group is a keto ($-\overset{|}{C}=O$) group, they are known as Ketoses

ex:- Dihydroxyacetone, Fructose

Based on the number of carbon atoms, the monosaccharides are regarded as trioses [3c], tetroses [4c], pentoses [5c] hexoses [6c] and heptose [7c]. The term along with functional groups are used while naming monosaccharides. For instance, glucose is aldohexose while Fructose is a ketohexose.
Triose : $[C_3H_6O_6]$ - Glyceraldehyde, DHAP
Tetrose : $[C_4H_8O_4]$ - Erythrose, Erythrulose
Pentose : $[C_5H_{10}O_5]$ - Ribose, Ribulose
Hexose : $[C_6H_{12}O_6]$ - Glucose, Glactose, Fructose
Heptose : $[C_7H_{14}O_7]$ - Heptose, pseudoheptulose

Hexoses :- Those with six carbon atoms are called hexoses viz glucose is ano aldohexose and Fructose is ketohexose.

C.chandrakale

Principal
VAAGDEVI DEGREE & P.G. COLLEGE
Kishanpura, Hanamkonda.

# Isolation purification and culture of microorganism:-

→ A pure culture is defined as a population containing only single species (or) strain of bacteria.

following three are the most commonly used methods of pure cultures in routine laboratory work:-

- spread plate method
- pour plate method
- streak plate method

Streak plate method :- this method is used most commonly to isolate pure cultures of bacteria.

a small amount of mixed culture is placed on the tip of an inoculation loop/needle & is streak across the surface of the agar medium. these plates are incubated to allow the growth of colonies by streaking, a dilution gradient is established across the face of the petri plate as bacterial cells are deposited on the agar sugar surface. each colony is the progency of singal microbial cell thus represting a clone of pure culture.

Such isolated colonies are picked up separately using sterile inoculating loop/ needle and restreaked into fresh media to ensure purity.
pour plate method :-

this method involves plating of diluted samples mixed with melted agar medium the main principle is to dilute the inoculum in successive tubes containing liquified agar medium so as to permit a thorough distribution of bacterial cells within the medium, mixed culture of bacteria is diluted directly in tubes a temperature of 42-45°c agar solidified below 42°c bacteria and the melted medium

are mixed well contents of each tube are poured into separate petri plates, allowed to solidify and then incubated when bacterial colonies develop.
isolated colonies are then picked up by inoculation loop and streaked into another petri plate to insure purity.
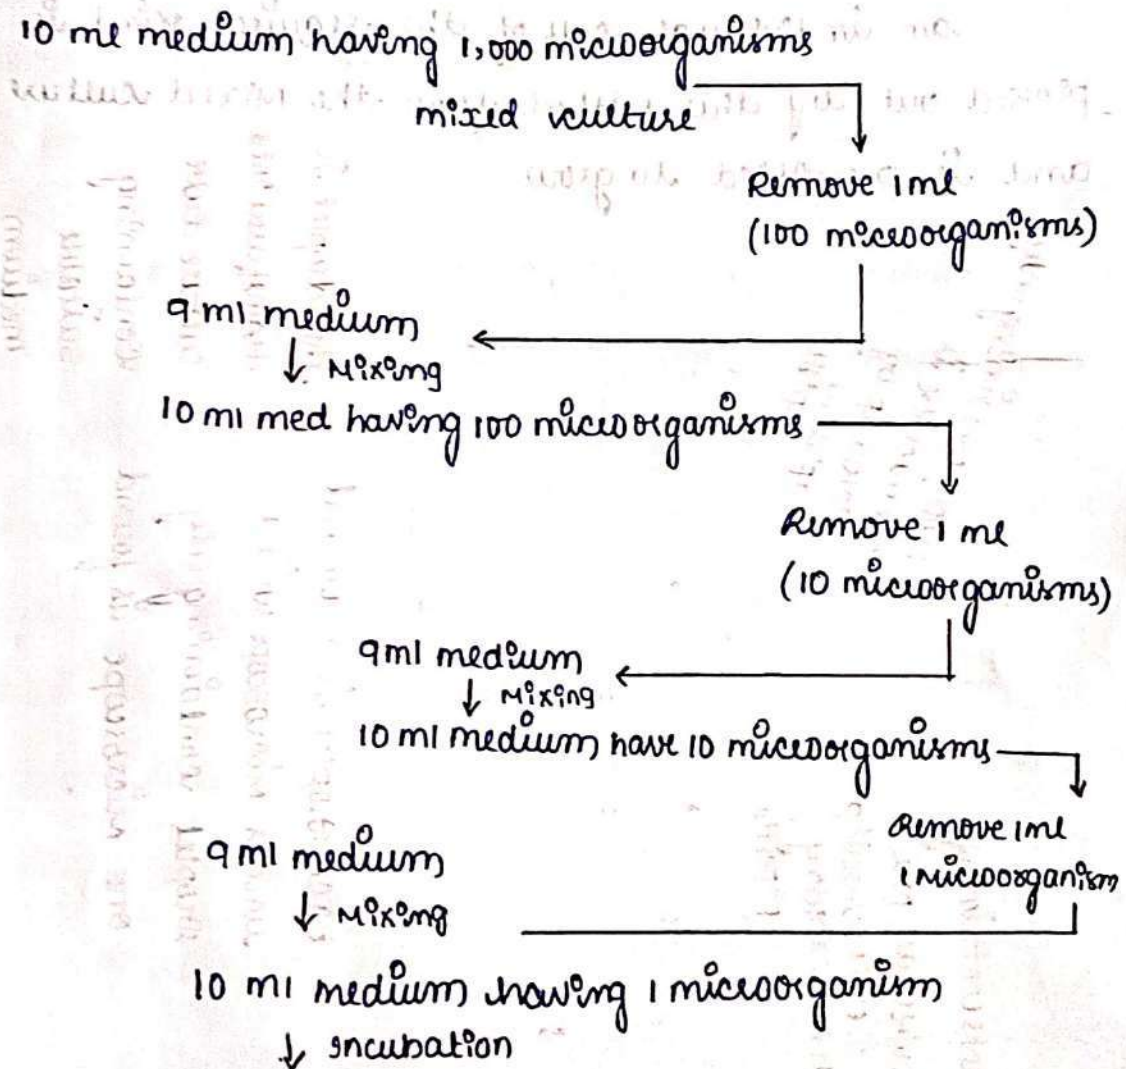

Spread plate method :-

In this method the mixed culture of a microorganism diluted in a series of tube containing sterile liquid, usually water or physiological saline a drop of so dilute liquide from each tube is placed on the centre of an agar plate & spread evently over the surface by means of a sterilized bent-glass road medium is now incubated well- isolated colonies grow the isolated colonies are picked up & transfeered into fresh medium to ensure purity. In contrast to pour plate method, only surface colonies develop In this method and the microorganism are not required to withstand the temperature of the melted agar medium.

mixed culture
Sample

water or
physiological saline

Isolated colonies
growing on the medium
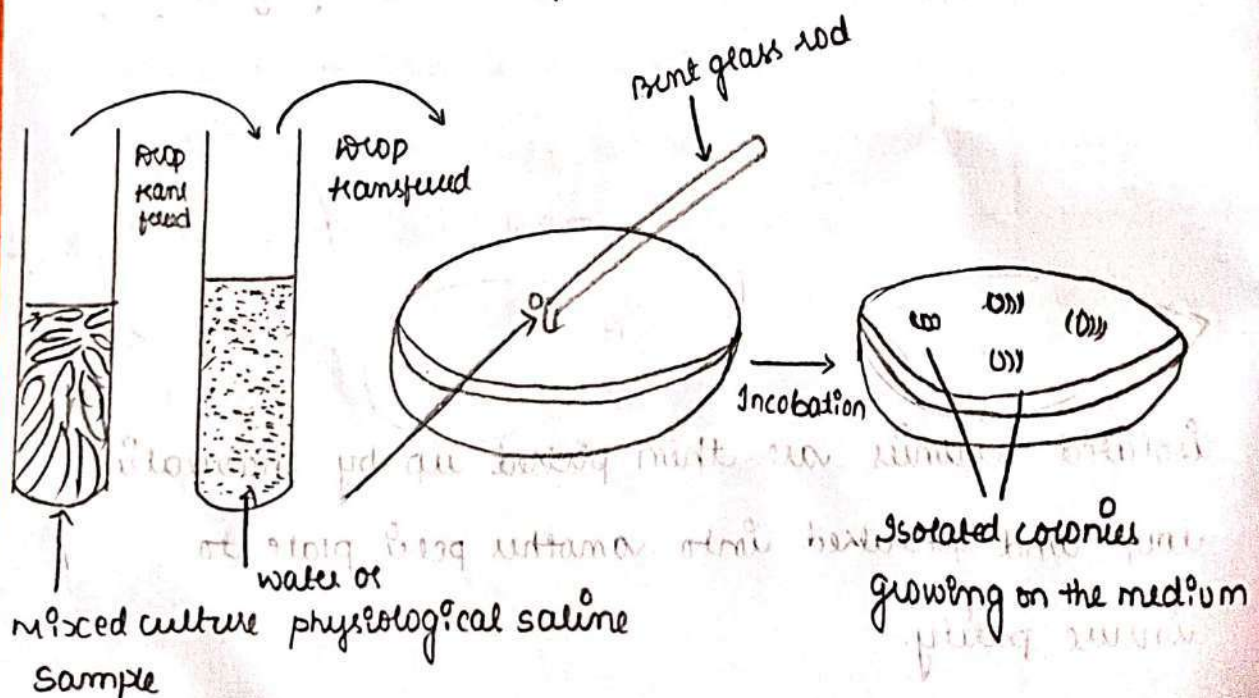

Serial Dilution method :-

this method is commonly used to obtain pure cultures of those microorganism that have not yet been successfully cultivated on solid media and grow only in liquid media. a microorganism that predominates in a mixed culture can be isolated in pure form by a series of dilutions.

10 ml medium having 1,000 microorganisms
mixed culture →

Remove 1ml
(100 microorganisms)

9 ml medium ←
↓ Mixing
10 ml med having 100 microorganisms →

Remove 1 ml
(10 microorganisms)

9ml medium ←
↓ Mixing
10 ml medium have 10 microorganisms →

Remove 1ml
1 microorganism

9 ml medium
↓ Mixing

10 ml medium having 1 microorganism
↓ incubation

the medium now containing millions of microorganism but, since, they all originated from single microorganism, its pure culture.

"Vector Analysis"

→ vector analysis is used to simplify same physical quantities like mechanics electro dynamics, fluid dynamics etc...,

Vector:- The physical quantity which as magnitude, and direction is called as vector

Ex:- displacement, velocity, force.

Scalar:- The physical quantity which as only magnitude is known as scalar..

Ex:- Temperature, mass, density....

Vector field:

when a physics quantitity express point to point in orgin of space is called as vector field

Ex:- Magnetic field, electric field, gravitational field.

Scalar field:- When a physical quantites magnitude express point to point in a region of space. is called as scalar field.

CENTRAL FORCES

* Central force is defined As a force which acted on a Partide or object is towards or away from a fixed Point.

Ex: gravitational force

Let us Consider two objects having mass m_1, m_2 one object is revolving around other object then the central force is [gravitational force]

$$f = - \frac{G m_1 m_2}{r^2}$$

Here
G = Gravitational force constant.

Ex: Electrostatic force.

If we Considerd on Electron the Electron is revolving around nucleus In a orbital the force experienced by the electron is a central force and is given by
$$F = \frac{1}{4 \pi E_0} \frac{q_1 q_2}{r^2}$$

1. Stokes theorem
2. Gauss divergence theorem
3. Newton's laws of motion.

⇒ **Stokes theorem** : Line integral of a vector field in closed surface is equal to the normal surface integral of a curl of a vector field Bounded by a curl.

⇒ If A is a vector field

$$\int A \, dl = \iint (\nabla \times A) \, ds.$$

⇒ By using stokes theorem we can convert line integral into surface integral.

PROOF :

Let us consider a surface "s" Bounded by curl "C". The surface "s" is divided by "n" no. of surfaces ds_1, ds_2, ds_3 ...... ds_n

These are bounded by curves C_1, C_2, C_3 .... C_n.

⇒ By the defination of a curl of a vector field is The maximum line integral of a vector field.

TRANSPORT PHENOMENON
* * *

$\longrightarrow$ **VISCOSITY**

* In a gaseous system the different layers may be have different velocities this will result in the relative motion of different layers with respect to each other in such a case the layer moving faster will transform momentum to the slowly moving layer. Thus the transport of momentum gives the phenomenon of viscosity.

* Let us Consider 3 layers of a gaseous system. The AB layer has velocity v it velocity gradient $\frac{dv}{dz}$

1) What is an Electric field reduce the electric field equation for a charged sphere when point Lies

a) inside the sphere

b) over the sphere

c) outside the sphere

A) At a point outside the charged sphere

Consider a sphere of radius 'R' with centre 'o' as shown in fig

Let a charge 'q' uniformally distri-buted over it.
Suppose 'p' be the external point at a distance 'r' from the centre 'o' of the sphere.

We shall find the electric field at this point. For this purpose we construct a Gaussian surface.

From the symmetry of charge distribution the Electric field at 'R' point of the Gaussian surface is the same field at 'R' point. and it will be ⊥ to the surface

∴ E is directed along the outward is normal

For a small Gaussian surface ds is also directed outwards.

$$\therefore \phi_E = \int E \cdot ds \cos 0 = \int E \cdot ds$$

$$\phi_E = \int E \cdot ds$$

$$\phi_E = E \int ds$$

$$\phi_E = E \left(4\pi r^2 \right) \text{ —— ①}$$

According to Gauss law

$$\phi_E = \frac{q}{\varepsilon_0} \text{ —— ②}$$

Subject physics

Sem -II

It describes the distribution of distinguishable particles of a system into different energy levels, let us consider a system of 'N' particles assume that there are 'ni' particles are occupying 'ei' energy level whose degenaracy is 'gi'

$N = n_1 + n_2 + n_3 \ldots \quad \sum_{i=1}^{io} n_i = \text{constant} \to ①$

$E = n_1 E_1 + n_2 E_2 + n_3 E_3 \ldots \quad \sum_{i=1}^{ipo} n_i E_i = \text{constant} \to ②$

Accroding to thermodynamics probablity of this system (weight) $W = g_i n_i$

Accroding to statistical mechanics entropy of a system is given by

$S = k \log w = \log g_i^{n_i} = k n_i \log g_i \to ③$

Differentlating and adding above the three equations
$dN + dE + d(k n_i \log g_i) = 0$

By solving these equations $n_i = \dfrac{g_i}{e^{\alpha + \beta E_i}} \to ④$

where $\alpha = \dfrac{\mu}{kT}$, $\beta = \dfrac{1}{kT}$, $g_i = \dfrac{4\pi V P^2}{h^3} dP$

The maxwell Boltzmann distribution law is applicable for liquid and gaseous system only

Maxwell - Boltzmann velocity distribution law:

According to maxwell - Boltzmann, the molecules of a system may have the velocity range from 0 to α By using maxwell's Boltzmann distribution law, the average number of gaseous molecules which are having the velocity from v to v+dv

Accroding to MB distribution law.

1. What is Transverse Impedance and Derive equation for it.

When a wave is transported in the string then opposite force which is acting against the transportation of wave known as Transverse Impedance. It is represented by 'z'.

It is also defined as ratio between transverse force to transverse velocity.

$$Z = \frac{\text{transverse force}}{\text{transverse velocity}} = \frac{(f)}{v}.$$

Consider a 'l' length of string vibrating with transverse force.

$f = f_0 \cos\omega t$ and the force which is acting downward direction is $-T\sin\theta$.

These two forces are equal to each other.

$$f = f_0 \cos\omega t = -T\sin\theta.$$
$$f = -T\tan\theta$$
$$f = -T\left(\frac{dy}{dx}\right)_{x=0} \quad\text——(1)$$

from the solution of Transverse wave.

$$y = A\sin[k(vt - x)]$$
$$k = \frac{2\pi}{\lambda}$$
$$y = A\sin\left[\frac{2\pi}{\lambda}(vt - x)\right] \quad\text——(2)$$

By diff w.r.t 'x'

$$\left(\frac{dy}{dx}\right) = A\cos\left[\frac{2\pi}{\lambda}(vt - x)\right]\left[-\frac{2\pi}{\lambda}\right]$$

$$\left(\frac{dy}{dx}\right)_{x=0} = -A\left(\frac{2\pi}{\lambda}\right)\cos\left[\frac{2\pi}{\lambda}(vt)\right] \quad\text——(3)$$

By diff eqn(2) w.r.t 't'

$$\frac{dy}{dx} = A\cos\left[\frac{2\pi}{\lambda}(vt - x)\right]\left[\frac{2\pi}{\lambda}v\right].$$

PHYSICS
ASSIGNMENT - 1.
Sem - V

1) Describe the postulates of vector atom model and write above the associated Quantum numbers.

* The Bohr and sommerfield atomic model couldn't explain the following points of the spectra of an atom

* Bohr doesn't explain the atomic spectrum of many electrons

* Both the models do not explains the fine structure of the spectral lines

* Both models do not explain zeeman stark effect.

* Both models donot explain the distribution and arrangment of electrons in orbit

* They do not explain doublet spectra of alkali atoms
In order to explain the above difficulties of two postulates were proposed in vector atom model
(i) space Quantization ii) Electron spin.

(i) Space Quantization - Bohr and sommerfield atomic models describes the motion of electrons around the nucleus only in orbit but these theory do not explain the orientation of an orbit in three dimension space

→ In presence of an external magnetic field the angular momentum vector (pl) of an electron makes a precession light motion above the applied field direction

1 Commom Emitter Configuration

→ In common Emitter configuration base is Input and collector is output and Emitter is common to the both base and collector.

*Input characteristics:-

-> It is the curve Draw between Base current $[I_B]$ and Base Emitter $[V_{BE}]$ at constant collector Emitter Voltage $[V_{CE}]$ the Circuit Diagram shown in below figure.
→ from the above Diagram we observe the C-E P-n-P transistor to observe base current $[I_B]$ one mille Ammeter $[V_{BE}]$ is connected between base and Emitter] volt meter $[V_{BE}]$ is connected between base and Emitter terminals to measure base Emitter Voltage.

→ To observe collector current $[I_c]$ at the output one another milli ammeter is connected and for collector Emitter voltage $[V_{CE}]$ one volt meter

Transistor :-   L. Geethanjali   08622-4445

n-p-n Transistor   MPCSA - VI SEM

The transistor in which a p-type semiconductor materi
-al is placed between two n-type semiconductor
material is known as n-p-n Transistor

➥ In a - transistor the 1st Segment (n-type) is
   called emitter and the 3rd large segment (n-type)
   is called collector. while the middle Segment (p-type)
   is called base Hence a -transistor can be defined as
   a three terminal semiconductor device

→ In -transistor -the current is due to the flow of
   both majority and minority charge carriers Hence
   it is also called bipolar junction Transistor.

→ A Transistor can be considered as a combination
   of a p-n Junction diode but it can't be constructed
   by using 2 diodes.

→ The circuit symbol of transistor is shown in fig

N-P-N

P-N-P
Construction :-

A transistor is a three terminal semiconductor device.

1. Explain the construction and working of Rc coupled amplifies along with it's frequency response.

When a transistor is used as an amplifier under 'CC' configuration the transistor must act in active region and during the both half cycles of input Ac signal the BE junction must be forward bias. moreover the input voltage should be more than 0.7V for si. The base emitter junction voltage V_{BE} is temperature dependent. Hence, whenever the temperature of the device changes the amplification of amplifier changes. Hence while designing an amplifier using a transistor, these factors must be addressed. One of the stable biasing circuit as an amplifier called 'RC' coupled amplifies is shown in figure.
→ In Rc coupled amplifies the stability issues of the device will be minimized by adopting a voltage divider bias circuit. It contains a series combination 2-resistors R_1 & R_2 which provide the required potential.

Topic := 1) Growth of current of decay of current in LR Circuit
         2) LCR parallel Circuit

LR- Circuit:

Growth of Current:

Let us consider an inductor of self
inductance `L' is Connected to a DC source `E'
through a resistor of resistence `R' and key `k'
in series

When the key is switched on the Current in
the Circuit Started to increases that the
Current in the Circuit increases, slowly to reach
it's steady state value.

* **Acc to KVL**

$$E = V_1 + V_2$$

$$E = IR + L\frac{dI}{dt}$$

$$\frac{1}{E-IR} = L\frac{dI}{dt}$$
$$\frac{1}{E-IR}\,dI = \frac{1}{L}dt$$

Multiply with `-R' on both sides

$$\frac{-R}{E-IR}\,dI = \frac{-R}{L}dt$$

$$\int \frac{f'(x)}{f(x)}\,dx = \log f(x) + C$$

Integrated above eqn

$$\int \frac{-R}{E-IR}\,dI = \frac{-R}{L}\int dt$$

Construct of JFET

FET can be frabicated with N-channel (or) P-channel for construction of N-channel a nenosemiconductor of N-type semiconductor is taken two p-type junctions are diffused on opposite sides these junction form two PN-diodes and there 2 p-region are interconnected. which is called as gate and the constacts made at 2 ends of the bar is called as source and another one is drain.
N-Channel
P-channel

If the bar is of N-type then it is called as "N-channel JFET" and if the bar is the p-type then it is called "P-channel JFET"

TRANSIENT RESPONSE OF RC- CIRCUIT

CHARGING OF CAPACITOR

* Let us consider a capacitor of capacitance c is connected to dc source 'E' through a resistor of resistance 'R' and A key K in series

→ When the key K is switched on the charging process of capacitor starts the charge on the capacitor increases with time and reaches maximum in short duration of time
Acc to KVL

$$E = iR + q/c \longrightarrow ①$$

$$iR = E - \frac{q}{c}$$

$$iR = \frac{CE - q}{c} \longrightarrow ②$$

$$R \frac{dq}{dt} = \frac{CE - q}{c} \qquad \left(i = \frac{dq}{dt} \right)$$

$$\left[\frac{1}{CE - q} \right] dq = \frac{1}{Rc} dt$$

Integrate above eqⁿ

* Design of basic Gates using the universal Gates
  NAND, NOR?

Universal Gates?

* NAND Gate is a universal Gate

⇒ NAND Gate is known as universal gate because
  it can be used to realize all the three basis logic
  function of an OR, AND NOT gate.

i) NAND as NOT Gate:

⇒ If the two inputs of NAND gate are connected
  together then we get 'NOT' gate.
$\overline{A.A} = \overline{A}$ ⇒ If A·B then 'NAND'
gate acts as NOT gate.

ii) NAND as AND gate:

(or)
. AB Boolean express
ion for AND.
iii) NAND as OR Gate:

⇒ OR gate can be made out of the three NAND
  Gates.

⇒ It complimented inputs are applied to NAND
  gate

ASSIGNMENT:

BIOTECHNOLOGY ASSIGNMENT

NAME : VUSHAKOVALA NAVYA

COURSE : Bt.MI·Z

SEM : VI

ROLL No : 086223810

TOPIC : BIODELIGNIFICATION

INVIVO-DEGRADATION :

a) B-O-4 ether degradation.

b) Bs-phenyl degradation pathway.

a) B-O-4 ether degradation by $\frac{1}{2}$ (C_α dehydrogenase)

Oxidizes hydroxyl group

→ B-etherase $+ \frac{1}{2}$ G(H) $\frac{1}{2}$ F

Cleave B-O-4 ether bond

Vanillin & α-hydroxy... propto vanillone

GS-HPV

Oxidized

$\frac{1}{2}$ Ce (Glyoxalase–S transferase)

Glutathione + — B-hydroxy propto vanillone

oxidized

Vanillin

b) S-(-)-DDVA dehydrodivanillate

2 step oxidation

$\frac{1}{2}$ x (DDVA O-demethylase)

demethylate Methoxy group

Hydroxyl group (Absorbate for oxidative ... cleavage by)

$\frac{1}{2}$ Z

OH-DDVA ... oxygenase

LIGNIN DEGRADATION / BIODELIGNIFICAT-ION BY ENZYMES

→ Lignin is one of the most important secondary metabolite produced by Phenylalanine/tyrosine metabolic pathway in plant cells.

→ Lignin is a phenolic polymer; amorphous; composite 3 dimensional.

→ It is an essential component of lignocellulosic biomass, where it accounts for about 15-30% of the dry weight.

→ Building blocks of lignin — hydroxy cinnamyl alcohols (monolignol)
  — p-phenyl alcohol
  — Sinapyl alcohol
  — p-Coumaryl alcohol.

DIFFERENT TYPES OF LIGNIN

→ Soft Wood Lignin — Coniferyl alcohol

→ Hard Wood Lignin — Coniferyl, Sinapyl, p-coumaryl alcohol.

→ Coffey Lignin — based on ... Ethylase & Carboxase

→ Grass & flax Lignin — High aliphatic co-group & amino and phosphate phenolic compounds.

→ Delicate Lignin — For polyester compounds

MICROORGANISMS INVOLVED IN LIGNIN DEGRADATION

→ Microorganisms like Cyanobacteria & Archaea also can have ...

→ ... of degradation ...

→ Hydrolyzed by $\frac{1}{2}$ 4 - (Vanillate) (4-oxalate mga Compound) (of OH-DDVA)

→ 4-Carboxy-2-hydroxy Pentadienoic acid + CVA
  (4-Carboxy Vanillic acid)
  Vanillate

Hall Ticket No : C88243806

Topic : Nutritional classification of Bacteria.

Submitted to : Supriya mam.

---

the growth, reproduction and metabolism.
- This energy comes from biosynthesis of different types of chemicals and elements present in our environment.
- Nutrition :- It is a substance used in biosynthesis of energy production and they are regulated for all living things.
- Bacteria required source of carbon, nitrogen, phosphorous and their ions and a large number of other nutrients.
- Carbon, nitrogen and water are used in high quantities.
- Nutritional requirements for bacteria can be grouped according to carbon and energy source.
→ Nutritional types of bacteria :
  I. On basis of energy source :
    a) Photographs
    b) Chemotrophs
  II. On basis of electron source :
    a) Lithotrophs
    b) Organotrophs
  Thus, bacteria can be
    → Photolithotrophs
    → Photoorganotrophs

NUTRITIONAL CLASSIFICATION

- Bacteria need energy and nutrients to complete various activities like growth, reproduction and metabolism.
- This energy comes from biosynthesis of different types of chemicals and elements present in our environment.
- Nutrition :- It is a substance used in biosynthesis of energy production and they are regulated for all living things.
- Bacteria required source of carbon, nitrogen, phosphorous and their ions and a large number of other nutrients.
- Carbon, nitrogen and water are used in high quantities.
- Nutritional requirements for bacteria can be grouped according to carbon and energy source.
→ Nutritional types of bacteria :
  I. On basis of energy source :
    a) Photographs
    b) Chemotrophs
  II. On basis of electron source :
    a) Lithotrophs
    b) Organotrophs
- Thus, bacteria can be

I. ELECTRON SOURCE

a) Lithotroph :- Use inorganic compounds as electron source.
b) Phototolithotrophs - Bacteria gain energy from light and they use inorganic inorganic compounds such as H_2O as source of electron.
   ex : chemotrophs
c) Organotrophs
d) Chemolithotrophs - Bacteria gain energy from reduced inorganic compounds such as NH_3 as source of electron.
   ex : Nitrosomonas
e) Organotrophs :- Some organisms can use organic compounds as electron donor.
f) Photoorganotrophs - Bacteria gain energy from light and use organic compounds such as succinate as their source of electron.
   ex : Rhodospirillum
g) Chemoorganotrophs - Bacteria gain energy from chemicals and use organic compounds such as glucose, amino acids as a source of electron.

---

a) Chemolithotrophs -
- These bacteria avoid requires light (look the light phase but have dark phase of Photosynthesis) and high proportion for their nutrition.
- Bacteria oxidize inorganic substances with the help of atmospheric oxygen.
- Energy released is used for synthetic process of the cell.
- Sulphuromonas (Sulphur bacteria) :
- Obtain energy by oxidation of elemental sulphur H_2S
  ex: Thiobacillus, beggiatoa
a) Elemental sulphur oxidizing bacteria :
   Thiobacillus denitrificans : detoxifying sulphur to ions, oxidize elemental sulphur to sulphate ion
   $$2S + 3H_2O + 3O_2 \longrightarrow 2H_2SO_4 + 122 \cdot 6 \text{-cal}$$
a) Sulphide oxidizing bacteria :
   Beggiatoa : oxidize H_2S and release the sulphur
   $$2H_2S + 4O_2 \longrightarrow 2H_2O + 2S + 19122 \text{-cal}$$
- Hydrogenomonas (Hydrogen bacteria) :

- They may be harmless/may cause diseases.
- Cause various diseases in plants and animals.
  ex: B. lymphatics, B. anthracis, B. leloni, Vibrio cholerae, B. tuberculosis etc.
- Symbiotic bacteria :
- These live in close association with other organisms as symbionts.
  ex: Rhizobium - live inside roots of leguminous plants.
  These fix atmospheric nitrogen into nitrogenous compounds which are utilized by plants. In return, plant provide nutrients and (products) protection to bacteria.
  Common examples of N-fixing bacteria
  ex: B. azotobacter, clostridium.

ASSIGNMENT

Subject : Bio-Technology

Name : Rakshita. O

College : Vaagdevi Degree & PG College

Class : BSc Life Sciences
        I Semester

Group : BTMC

Submitted to : Supriya mam

Topic : Ultra structure of Prokaryotes.

PROKARYOTES

ULTRA STRUCTURE OF PROKARYOTIC CELL

- Prokaryotic cell is the structural unit of two microbial groups
  → Archaebacteria
  → Eubacteria
- Despite variations in shape, size and fundamental structures are same.
- Definition :- Prokaryotes are organisms where whole cell lack a nucleus and other organelles intracellular organisms that lack membrane bound structures.
- Word Prokaryote comes from Greek where Pro- before/primitive / first formed ; karyon - nut / kernel.
- Each Prokaryotic cell consists of protoplasm encased with in cell envelope.
- Ultra structure of Prokaryotic cell particularly a bacterial cell consists of cell envelope, cytoplasm, nucleoid, plasmids, surface appendages.
- Lacks certain organelles like mitochondria, endoplasmic reticulum and golgi bodies.

CELL ENVELOPE

- It is a protective covering of bacterial cell with three layers i.e. Glycocalyx, cell wall and cell/plasma membrane.
i. Glycocalyx : Outermost layer of cell envelope.
   - made up of polysaccharides
   - when it becomes thick / tough it is called as "Capsule"
   - when it forms loose sheath it is called as "Slime layer"
   Functions : protects cell from desiccation, toxins and phagocytes.
   Helps in adhesion, homogeneously & virulence.
ii. Cell wall : It is rigid outermost layer of cell envelope, composed of peptidoglycan with amino acids joined by β-1,4 linkage.
   Functions :
   - Provides shape and rigidity to cell.
   - It helps in preventing bacterium from osmotic bursting in a hypotonic solution.
   - It helps in β-glycolinkage formation.
   → In Gram positive bacteria : cell wall is single layered with thickness of 10-80nm, having a thick peptidoglycan layer and no extra lipid membrane.

Peptidoglycan (25%)	Peptidoglycan	→ cell wall
		→ cell membrane
Gram -ve	Gram +ve	

- It is a gel like matrix composed of 80% water, organic nutrients, vitamins, gases, inorganic ions and many low molecular weight compounds and cell structures such as ribosomes, chromatophores, nucleoid, poly-β-hydroxybutyrate and mesosomes etc.
  Functions : provides structure to cell, site of many metabolic reactions, the medium in which organelles are found.
i. Mesosome :
   - these are infoldings of plasma membrane.
   - When connected with nucleoid called Septal Mesosome, when it is not connected called Lateral Mesosome.
   - Helps in cell wall formation, chromosome replication, secretory activity, increase surface area of plasma membrane.
   - Site of respiratory enzymes hence called mitochondria of prokaryotic cells / bacterial mitochondria.
ii. Chromatophore :
   - these are internal membrane systems of prokaryotic cells.
   - these increase the metabolic area.
iii. Ribosomes :
   - Prokaryotic ribosomes contain 70s type of ribosomes in nature with 50s larger subunit and 30s smaller subunit.

SURFACE APPENDAGES

- Surface appendages are present on bacterial cell, these may include flagellum, pili and fimbriae.
i. Flagella : It is made up of "flagellin" protein.
   - It is long, fine, hairy structure. It is not present in all bacteria outside the surrounding.
   - It helps in locomotion in a whip-like manner.
     → Basal body : made up of two rings i.e. LM ring, MS ring
     → Hook : It is curved structure, about 45nm long, that connects basal body and filament.
     → Filament : hollow cylindrical structure about 20nm long and 20nm in diameter.
ii. Pili : These are tubular outgrowths of bacterial cell surface with 10-20nm in length.
   - It is made up of "pilin" protein.
   - It helps in conjugation.
iii. Fimbriae :
   - These are bristle like surface appendages help in adhesion and mutual clinging.
   - Length varies from 0.3-1.5nm and diameter of 3-10nm.

ACADEMIC YEAR 2023-24

GROUP DISCUSSION

In the Academic year 2023-24 we Botany Department conducted Group Discussion on the Topic — "Impact of Social media" under the supervision of Dr Sateesh Suthari, HoD, Botany Dept, R. Bhargavi, A. Kavitha & K. Manisha.

This competition was conducted on which was successful by the active Participation of students.

Group - A

1.	08624	—	3316	—	G. Harshith
2.	"		3331	—	A. Rajitha
3.	"		3513	—	G. Rajasri

ACADEMIC YEAR 2023-2024
I YEAR I SEMESTER

In the academic year **(2023-2024)** for the students of **I** year **I** semester, we conduct a **quiz competition** in chemistry to enhance basic knowledge in chemistry.
Students are participated actively shows their interest positively.
It was conducted on DATE……………..

TOPIC: - CHEMICAL BONDING.

GROUP "A"		GROUP "B"	now III FS STUDENTS
H.T.N O.	STUDENT NAME	H.T.NO.	STUDENT NAME
1. 086243901	Pavani	1. 086243902	Kishore
2. 086243904	Shivani	2. 086243912	Anjali
3. 086243906	Rohith	3. 086243919	Nikhil

RESULT: All groups showed keen interest in the competition and finally group-**A** was the winner and group-**B** was the runner-up team.

ACADEMIC YEAR 2023-2024
II YEAR I SEMESTER

In the academic year 2023-2024 for II year I semester we conducted a quiz competition in chemistry to enhance their knowledge in chemistry.

Most of the students showed their interest and participated actively it was conducted on DATE…………………

TOPIC: CHEMISTRY OF F- BLOCKS ELEMENTS.

GROUP "A"		GROUP "B"	5TH SEM
H.T.N O.	STUDENT NAME	H.T.NO.	STUDENT NAME
1. 086233651	Koushika	1. 086233656	Tharun
2. 086233653	Sriteja	2. 086233659	Akhila
3. 086233654	Sagar	3. 086233663	Lohitha

RESULT: All the students are participated actively **group- B** was the winner.

ACADEMIC YEAR 2023-2024
III YEAR I SEMESTER

In the academic year **(2023-2024)** for the students of **III** year **I** semester, we conducted a group discussion about chemistry in everyday life.
All the science and math's students participated actively.

Group-A students started the debate about positive response on topic, they were explained detail about use of chemistry in daily life.

Group-B students debated about effects of chemicals on environment.
It was conducted on DATE…………………….

TOPIC: - CHEMISTRY IN EVERY DAY LIFE.

GROUP "A"		GROUP "B"	
T. NO.	**SUDENT NAME**	**T.NO.**	**SUDENT NAME**
1. 086223251	navi	1. 086213336	Swathi

086223253	nthoshini	086213344	Abhinaya
086223255	avani	086213353	Srivarsha

RESULT: After an active participation of all students Group-A won the today's competition in group discussion about CHEMISTTY IN EVERY DAY LIFE.

ACADEMIC YEAR 2023-2024
l YEAR II SEMESTER

In the academic year **(2023-2024)** for the students of **I** year **II** semester, we conducted a **WORK SHOP** on CHEMICAL HANDLING SAFETY METHODS.

It was my organization of department of CHEMISTRY on DATE…………………..
Successfully workshop was organized by Dr**. B.Sabitha** and **Sd.Yakoob**.

RESULT: After an active participation of all students WORK SHOP was conducted smoothly and successfully.

ACADEMIC YEAR 2023-2024
II YEAR II SEMESTER

In the academic year 2023-2024 for II year II semester we conducted a quiz competition on GENERAL CHEMISTRY techniques and the importance of chromatography in research level.

It was conducted on DATE…………………………..

GROUP "A"   **GROUP "B"**

H.T.N O.	STUDENT NAME	H.T.NO.	STUDENT NAME
1. 086224002	A. Karthik	1. 086224005	CH. Vijay vardhan

1. 086224017	R.Ranjith	1. 086224020	R.Pavithra
2. 086224019	M.Bhuvaneshwar	2. 086224001	A.Rishiteja
3. 086224022	S.Arun kumar	3. 086224004	B.Mahendar

GROUP - A&B   **GROUP - C&D**

RESULT: All groups showed keen interest in the competition and finally group-A was the winner and group-B was the runner-up team.

ACADEMIC YEAR 2023-2024
III YEAR II SEMESTER

In the academic year **(2023-2024)** for the students of **III** year **II** semester, we conducted a **WORK SHOP** on functioning of **DISTILL WATER PLANT.**

It was conducted on DATE……………………….

RESULT: Students are actively participated and well educated about the **DISTILL WATER PLANT**.

VAAGDEVI DEGREE AND PG COLLEGE

KISHANPURA,HANAMKONDA

DEPARTMENT OF BIOTECHNOLOGY

ACTIVITY: Quiz competition

ORGANISING DEPARTMENT: Department of Biotechnology organised quiz competition on the occasion of SCIENZA event.

PARTICIPANTS: students from other colleges and also B.Sc. science students from Vaagdevi College have been participated in the event.

NUMBER OF ROUNDS: 3 (Written quiz, group quiz, final round photo display)

FINAL ROUND:

OUTCOME: Among all participants, those who qualified for both rounds are called-up for final round. In this, participants are divided into two groups. Group-1 won in quiz.

ACADEMIC YEAR 2023-24

"Quiz Competition"

In the Academic year (2023-24) Department of Botany conducted "Quiz Competition" on the Topic - rDNA Technology to enhance the Competitive spirit and encourage the students to Participate actively and enrich the students scientific knowledge.

It was conducted on 1 1 2023 under the supervision of Botany Head of the Department Dr. Sateesb suthari, R. Bhargavi, A. Kavitha & K. Manisha which was successfully conducted due to students active Participation.

TEAM - A

1.	086-23	—	3311	—	M. Meghamala
2.	"		3312	—	M. Nithin
3.	"		3318	—	P. Navya

Quiz

Name of the activity : Invertibrates

Team A

1.Almas

2 J.Nikitha

3.T.Akhila

4.N. Nikitha

Team B

1.B.Aparna

2.S.Rahul

3.P.Shivathmika

4.K. Keerthana

Team c

1.A.Sahithi

2.Riyaz

3.Hari priya

4.P.Ravikiran

Total points:20

Team A won the quiz competition by securing 18 points

Name of the faculty Dr P.Suresh

p.suresh

As per the activeness of the students considering their punctuality, discipline,regularity and levels of grouping the concepts the following students are considered as advanced learners

Project title: Identification of different types of mosquitoes

SNO	NAME OF THE STUDENT
1.	B.sindhuja
2.	Krishnaveni
3.	N.Sahithi
4.	B.Lavanya
5.	Almas
6.	N.Nikitha
7.	k.keerthana
8.	M.Varshitha
9.	A.Sahithi

Result: Students were able to understand and identify mosquitoes in Warangal urban and rural areas .They are differentiated as Aedes,Anopheles and culex mosquitoes

Aedes Egypti: Dark brown with two white stripes in the shape of lyre on its back.

Culex mosquito: Light brown with light coloured band around its proboscis.

Anopheles mosquito: Light brown with dashed black marks on wings typically rests with abdomen anophelous contributes 44% culex 39% aedes 30% in

ruraland urban areas
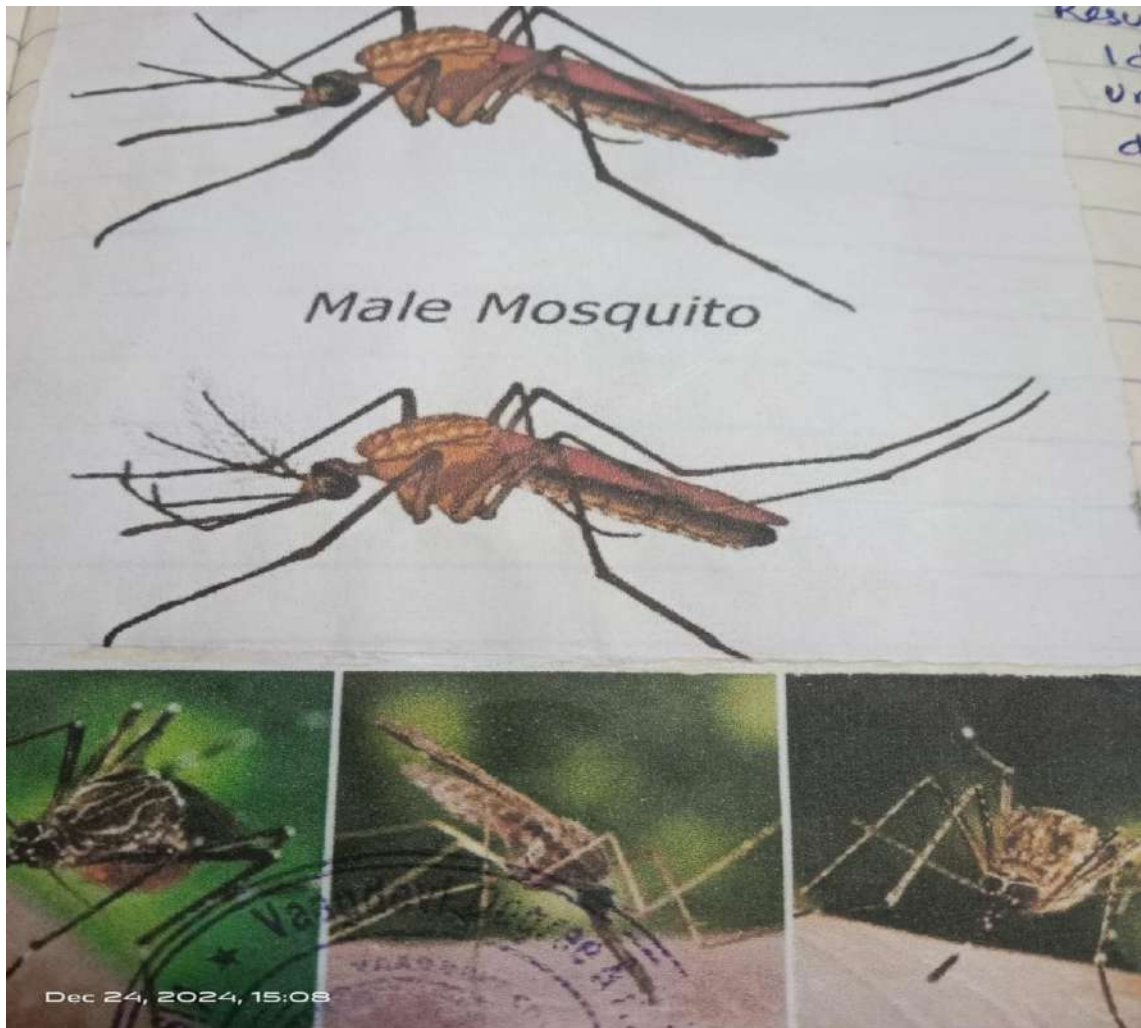

Male Mosquito
